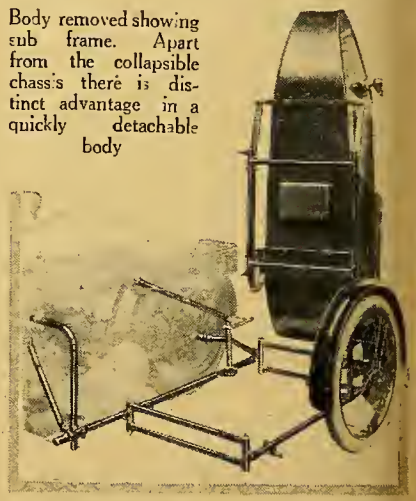
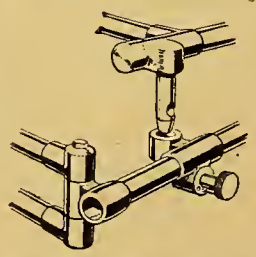
The light-weight type is so arranged that taper pegs slide into horizontal sockets on the front cross member, while extensions of the rear tube drop into suitable vertical sockets and are held therein by spring clips. In the heavier model double parallel tubes are employed for the cross members, and vertical pegs brazed on at each corner of the sub-frame drop into vertical sockets and are locked at two opposite corners by spring pegs. It should be pointed out that the locking pegs and clips in the two instances mentioned are totally unnecessary as regards safety, but are employed merely to prevent rattles when there is no passenger in the sidecar.

In addition to the advantages enumerated above, the simple method of body attachment provides great scope for the small tradesman who utilises his sidecar with a box body for light deliveries through the week, and can in the space of a few minutes change over to a touring body for week-ends or holiday purposes.

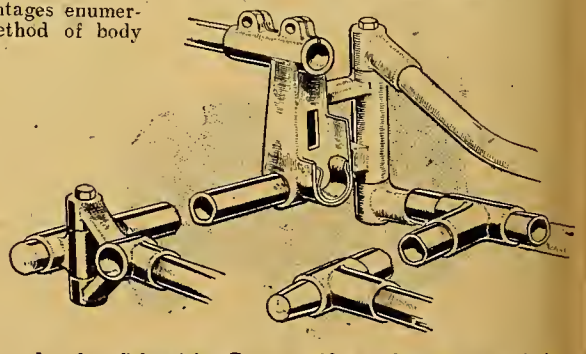


Body removed showing sub frame. Apart from the collapsible chassis there is distinct advantage in a quickly detachable body

In construction the Dorway chassis is robust, and the workmanship throughout is excellent; all pivot joints are of first-class fit and are packed with grease to prevent rusting up, and the construction is such that the complete outfit is perfectly normal in appearance, any type of flat-bottomed body being suitable.



Spring plungers at two of the four corners lock the sub-frame of the collapsible chassis in the heavier type of Dorway sidecar



In the lightweight Dorway sidecar the sub-frame locks to the chassis by means of taper sockets in front, and tubular extensions dropping into the sockets at the rear

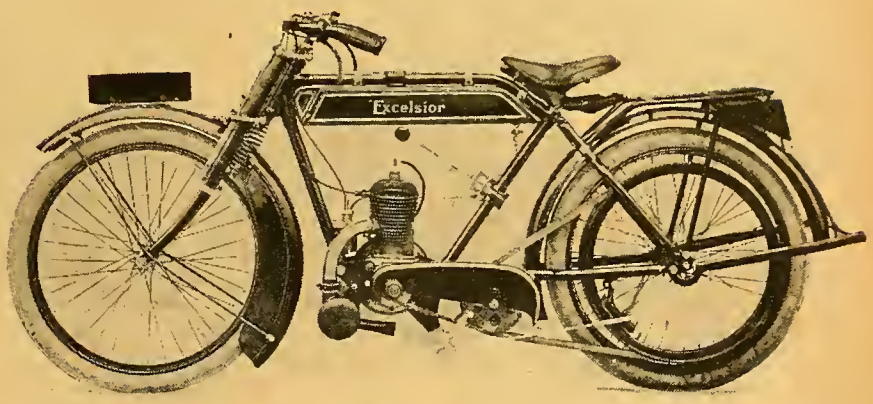
NEW EXCELSIOR MODELS.

Miniature Solo Mount of Light Weight and Low Price Introduced.

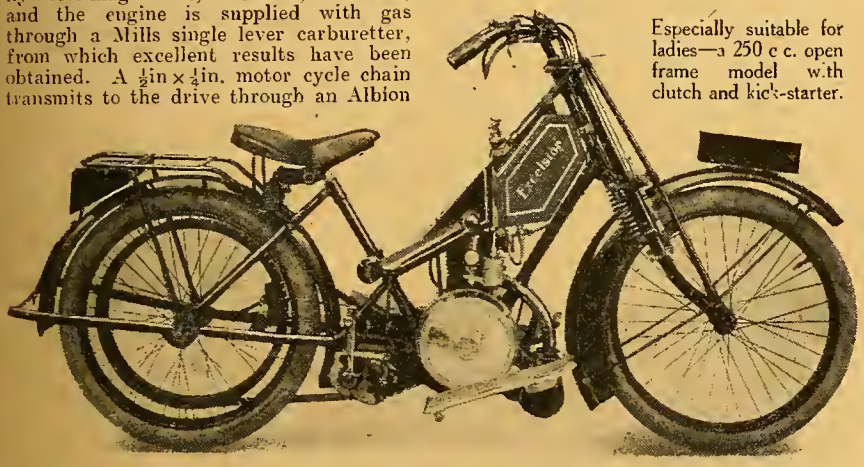
INCLUDED in the Excelsior range for 1923 is a new miniature two-stroke fitted with the latest type 147 c.c. Villiers engine.

This machine, complete with two-speed gear, will sell at the price of £28 10s., and since both an electric lighting set and engine shaft clutch can be fitted at a very moderate figure, it is probable that £35 will cover the cost of a most completely equipped lightweight.

Although many people consider that so small a machine is something of a toy, nevertheless, from personal experience, we may state that this example is a thoroughly practical little machine, well suited to the needs of an enormous number of people. Gear ratios of 6½ to 1 and 13 to 1 enable the little engine to maintain a steady speed of well over the legal limit if necessary, and to climb any hill which is likely to be encountered by the average rider. Added to this the little engine is beautifully balanced, and is almost vibrationless, slipping along quietly and without fuss. The Villiers flywheel magneto is, of course, a feature, and the engine is supplied with gas through a Mills single lever carburetter, from which excellent results have been obtained. A ½in. × ¼in. motor cycle chain transmits to the drive through an Albion two-speed gear box, the final drive being by three-quarter inch belt. 24in. × 2in. Avon tyres are fitted. In spite of the small proportions of this little machine no essential details have been omitted; the mudguards are of sensible width, and half valanced in front; a deeply flanged top chain guard is fitted; Druid forks are employed, and the saddle is of sensible proportions. The weight is approximately 110lb.



An Excelsior lightweight fitted with 147 c.c. engine; an attractive low-priced model.

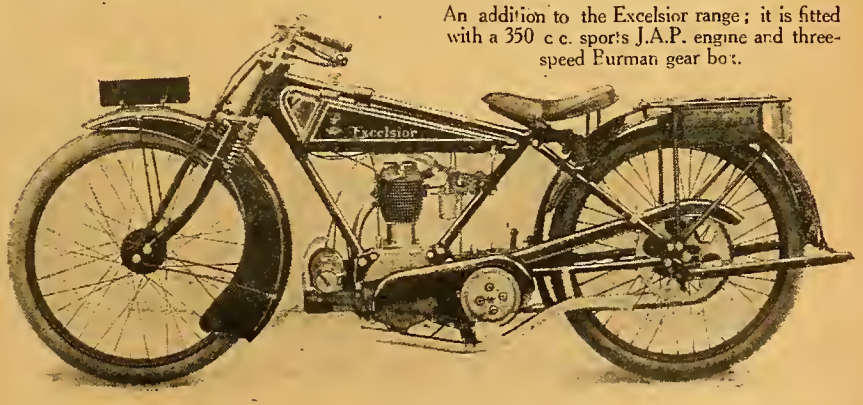


Especially suitable for ladies—a 250 c.c. open frame model with clutch and kick-starter.

More Powerful Models.

Next in engine size amongst the products of Bayliss, Thomas and Co., Ltd., come two models, both fitted with 250 c.c. Villiers two-stroke engines, the specifications of these machines being similar, since they both have flywheel magneto, Sturmey-Archer two-speed gear, clutch and kick-starter, Druid forks, and 2¼in. tyres, but the first has a normal frame with sloping top tube, and has 26in. wheels, and is listed at £48. The second is an open frame model with 24in. wheels, which has been a feature of the Excelsior range for some time past, and is listed at £50.

The well-known 349 c.c. Blackburne engined Excelsior remains almost unchanged; it is fitted with a Burman three-speed gear, clutch and kick-starter. Druid forks, 26in. × 2¼in. wheels, and internal expanding brakes front and rear. The price is £67. At the same price, however, a new model will be listed. The specification is exactly as above, but a 350 c.c. special J.A.P. engine is fitted, and with its all-chain drive, large silencer, and sensible mudguards, it forms a most attractive addition to the existing range. The needs of sidecarists are catered for by the 976 c.c. sidecar outfit, fitted with side-by-side valve, J.A.P. engine, Burman three-speed gear, with all-chain drive, 28in. × 3in. tyres, and internal expanding brakes front and rear. At the price of £123, it is an attractive proposition.

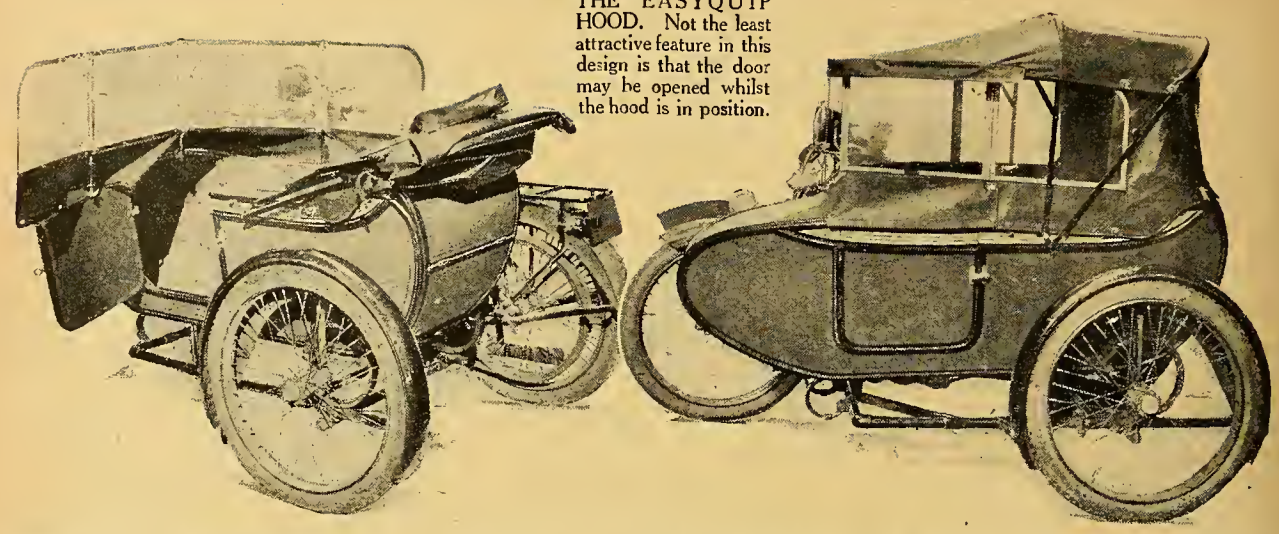


An addition to the Excelsior range; it is fitted with a 350 c.c. sports J.A.P. engine and three-speed Burman gear box.

LUXURIOUS HOOD EQUIPMENT.

SIDECAR luxury has now been developed to such an extent that it would seem difficult to make any further great improvements. Yet the Easyquip hood and screen has been designed to convert a normal sidecar body into the equivalent of a cabriolet.

The V-fronted celluloid screen is mounted on the fore part of the body, the lower portion being attached to the bodywork by fabric shields giving neat and tidy lines. The screen is supported on vertical rods, that on the door being



THE EASYQUIP HOOD. Not the least attractive feature in this design is that the door may be opened whilst the hood is in position.

so designed as to permit its opening without interference. The celluloid screens are mounted in aluminium beadings and are detachable therefrom should replacement become necessary. In addition to this, side members on similar lines are fitted, and these again do not interfere with the opening of the door; the whole side with the front screen panel bodily hinges back while the hood is still in position. The hood itself has a V-front to match the screens, and a single strap attachment secures it when in use, while when folded back it is covered by a waterproof case.

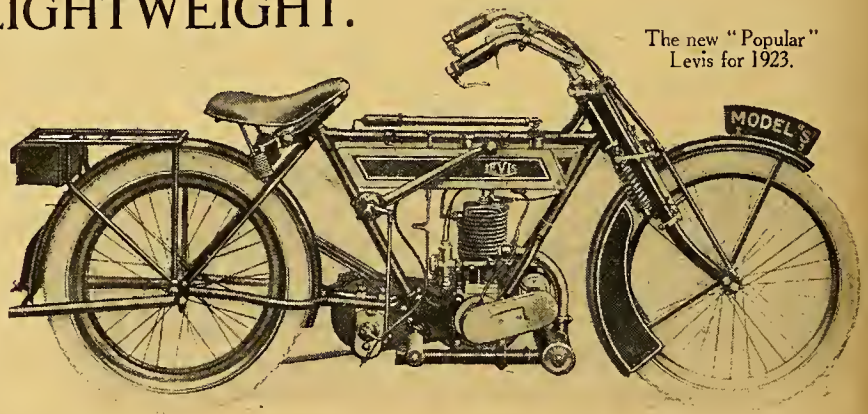
The hood and fittings may be obtained in waterproof leatherette, or twill. A diamond-shaped celluloid panel is fitted to the back of the hood, and the workmanship is well carried out. One cannot say more than that Easyquip fittings provide full protection when in use, while allowing perfect freedom of entrance and exit when desired, yet, in addition, any part such as the side screen and curtains may be readily detached and left at home if not required. It should be mentioned that there is an extraordinary absence of wing nuts and such like accessories which are usually part and parcel of hoods, side screens, etc. The manufacturers are Coventry Equipments, Ltd., Clarendon Works, Coventry.

A POPULAR LIGHTWEIGHT.

A £48 Model to replace the 1922 £60 type.

AS one of the machines which proved the possibilities of the two-stroke engine, the Levis has always been one of the most popular lightweights on the market. The full programme for 1923 has not yet been finally settled, but it has been decided to introduce a £48 model to replace this year's £60 machine. This little solo mount has an engine of 211 c.c. and is fitted with a Sturmey-Archer two-speed gear with clutch and kick-starter.

It will be seen from the illustration that this new model "S" is an attractive machine at a very moderate price.



The new "Popular" Levis for 1923.

THE LATEST EDMUND MODELS.

One of the most attractive machines at last year's Olympia Show was the semi-spring frame Edmund. Two of the 1923 models are shown above—the 349 c.c. o.h.v. sports and the 499 c.c. tourist type, both being fitted with Blackburne engines.

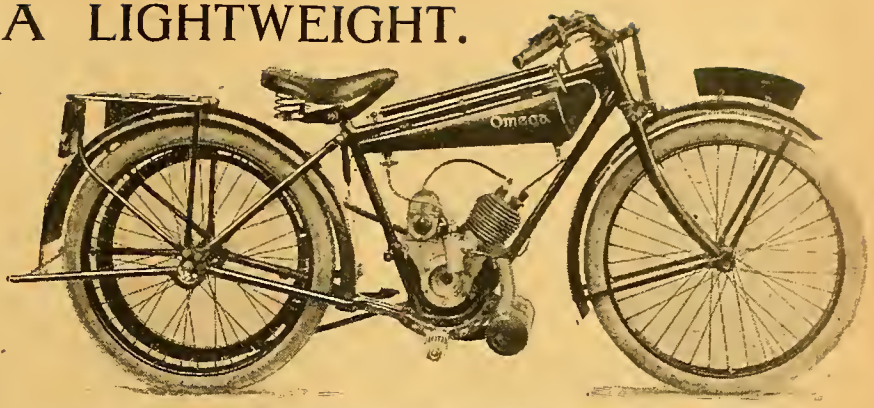
ANOTHER ULTRA LIGHTWEIGHT.

A New Omega with 170 c.c. Two-stroke Engine.

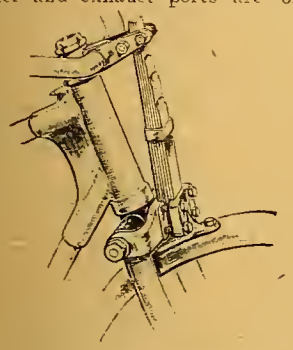
A 170 c.c. two-stroke Omega is the latest ultra lightweight, a type which promises to be one of the features of the show next month. To be known as the Omega Junior and manufactured by W. J. Green, Ltd., Stoke, Coventry, the new model weighs but 96lb. and is designed to provide a saddle height, in the lowest position, of no more than 26 inches from the ground.

In detail the 60×60 mm. engine is thoroughly well made, having a one-piece overhung crankshaft with a very long bearing. The big end bush is of phosphor bronze, but the gudgeon pin is fixed in the connecting rod and floats in a cast-iron two-ring piston.

The engine, which is of the normal three port type slopes to the front, and in order to avoid the exhaust pipe fouling the front down tube the cylinder is turned slightly on the crank case, so that the transfer and exhaust ports are off the centre line of the frame. A further interesting point is that the cylinder is offset in relation to the crankshaft by ⅜ of an inch. A Fellows magneto is carried on a platform cast on the crank case behind the sloping cylinder, and gas is supplied by a single lever carburetter.



Between the motorised bicycle and the lightweight touring machine—the 170 c.c. Omega Junior.



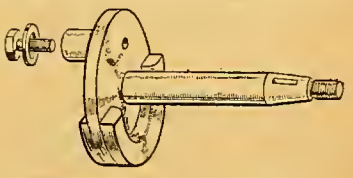
A vertical laminated spring is used in the Omega-Junior fork.

A light loop frame with single top tube is used, and extra stiffness is ensured in the neighbourhood of the loop by a pair of curved steel members which are drilled at spaces of approximately an inch apart so as to provide alternative positions for the foot rests.

24in. ×2in. tyres are fitted, and lubrication is by the petroil system, the tank, which carries approximately a gallon of fuel, having a separate oil tank with a suitable measure combined with the filler.

An unusual feature is to be found in the front fork, which is pivoted below the steering head and employs a vertical leaf spring attached rigidly to the crown and capable of sliding in a link attached to the steering head. We can speak highly of this fork in action, for a short trial run convinced us not merely of the wonderful pulling powers of the tiny engine but also of the general comfort of the machine.

In spite of the fact that a single gear of 6½ to 1 was fitted to the trial machine it was very flexible. In this form the machine will sell at £25. With two-speed gear the price is to be £32, and a further £4 will be added for clutch and kick-starter. In addition to this a single geared clutch model will be marketed at the approximate price of £27.



Overhung crankshaft of the new ultra lightweight.

A BETTER TAXATION SYSTEM IN 1924.

HAS the Government realised that the taxation system, introduced in January, 1921, has been proved to be unsatisfactory? Whatever the feeling in 1920, when the present system was introduced, there is certainly a tendency now to consider favourably a petrol tax.

Owing to the necessity for securing legislative sanction to any acceptable alternative, the present system must remain until the end of 1923. Nevertheless, it is satisfactory to learn that efforts are being made to bring about a more equitable system.

The question of taxation has many times been discussed in these columns, and we have shown that to obtain taxation in proportion to the type of machine used and the mileage such machine is used, there are only two factors which can be considered, namely, tyres or fuel.

For many reasons a tax on tyres would be open to criticism; for example, one may have the ill luck to cut a new cover very badly. A little consideration will show that a tax on fuel would be far better, and the present system eventually will be abandoned in its favour.

A memorandum has been prepared by the Motor Legislation Committee representing the views of the Auto-Cycle Union, the Automobile Association and Motor Union, the Royal Automobile Club, the Royal Scottish Automobile Club, and the principal trade organisations, to be submitted to the Departmental Committee of the Ministry of Transport.

The system of taxation suggested is a flat rate on motor spirit, to be levied at the port of entry. It is not suggested that any excise duty should be imposed on benzole, pure alcohol, or kerosenes. It is suggested that motor spirit should be defined by flash-point and distillation tests, and that the use of paraffin be allowed by special licence.

The main objection to the present system, says the memorandum, is that vehicle taxation has no regard to road usage, which is obviously an important factor in road wear, and that the tax is the same whether the vehicle travels 400 or 40,000 miles per annum. It is also shown that the present system tends to restrict the use of vehicles to certain periods of the year, *i.e.*, 15,760 motor cycles were licensed during the first quarter of 1922, and 62,846 during the second.

No rebates of any kind are suggested as regards motor spirit used for road purposes.

The signatories to the memorandum inform the Ministry that at a later date they will be prepared to indicate the amount of motor spirit to be used necessary to produce in 1924 the figure at which they could agree with the Government as a reasonable contribution from mechanically-propelled road vehicles towards road expenditure.

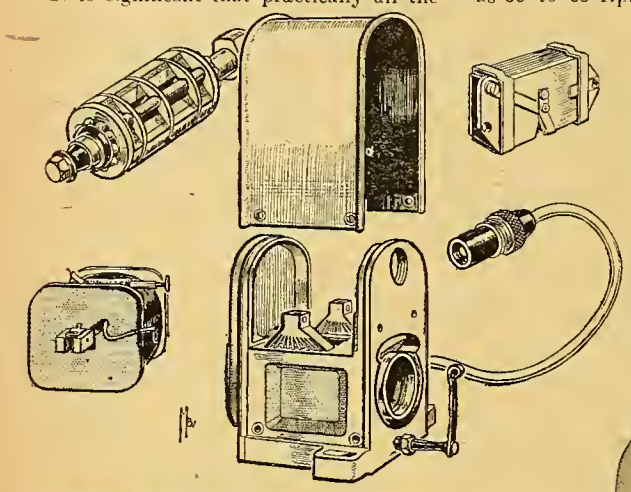
With a motor spirit duty of 5d. a gallon, a nominal registration duty equivalent to 2s. 6d. per h.p., for cars, a nominal registration duty of £1 on goods and hackney vehicles, of £2 on vehicles exceeding 3 tons, and 7s. 6d. on motor cycles, a gross revenue of £10,315,000 is anticipated. With a motor spirit duty of 4d. and a 75% reduction on the existing taxes, which would mean that motor cycles would average at 12s. 6d. registration, the gross revenue would be £10,375,000.

ADVANCED MAGNETO DESIGN.

Rotating Magnet with Stationary Armature and Contact-breaker in New B.L.I.C. Model.

WITH the increasing demands of the modern high-speed engine upon its ignition apparatus, improvement in magneto design is a matter of continual urgency.

It is significant that practically all the modern departures in magneto design from the conventional pre-war Continental pattern, both electrically and mechanically, have originated in this country.



Component parts, showing great accessibility

The latest development is the new B.L.I.C. magneto, from which the rotating armature and stationary horseshoe magnet are eliminated; instead a stationary winding has its armature poles extended, and between them revolves a small magnet of cobalt steel, which only weighs 12 oz. The armature poles are laminated and high efficiency is obtained, good sparking being characteristic at speeds as low as 50 to 60 r.p.m. The total weight of the single-cylinder magneto is 3½ lb.

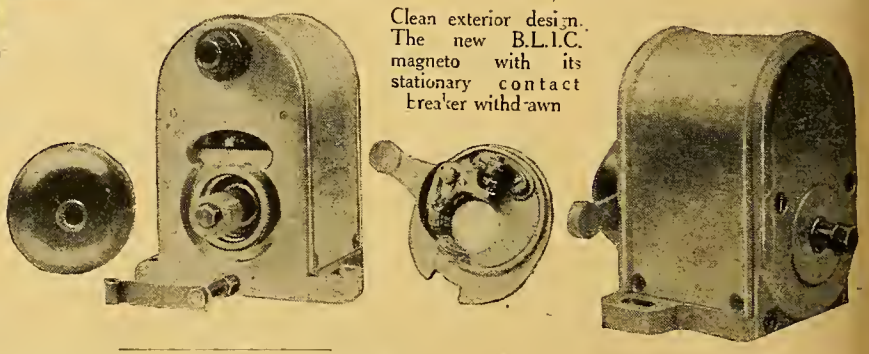
The pole shoes are incast in the aluminium body of the magneto, and the armature is mounted across these. The armature high tension connection makes direct contact with the end of the high tension lead, there being no slip rings, brushes, or brush holders. The rotating magnet is about the same size as the average armature winding.

A stationary contact-breaker is employed, and it is operated by a cam carried on the brass spindle of the revolving magnet—the only rotating part.

Great Advantages.

Obviously a great advantage inherent in this form of construction is that the mechanically weak high-tension windings of the armature windings are not subjected to the intense centrifugal stresses of the ordinary magneto. This advantage, of course, has previously been obtained in magnetos of the polar inductor type, but at the expense of several air-gaps in the magnetic circuit. In the B.L.I.C. instrument these air-gaps are no more than in the conventional rotating armature magneto, while the path of the magnetic flux is equally short.

The makers are the British Lighting and Ignition Co., Ltd., Cheston Road, Aston, Birmingham.



Clean exterior design. The new B.L.I.C. magneto with its stationary contact breaker withdrawn

ULSTER GRAND PRIX.

H. W. Hassall (Norton) wins at over 60 m.p.h. by covering 143½ Miles in 1 hr. 42 mins 9 secs.

H. W. HASSALL (Norton) won the Grand Prix Road Race promoted by the Ulster Motor Cycle Club on Saturday last. It was a very popular win, for there are few parts of the country where the Norton is more favoured than in Ulster, and, while perhaps the local populace would have been better pleased had the winning Norton been steered by Jimmy Shaw, a great reception was accorded to the Birmingham rider.

Shaw was going well when he punctured on the fifth lap.

The race was held over a triangular circuit of 20½ miles, which had originally been selected for the suggested light car race, and seven laps of it were covered; it lay on the outskirts of Belfast, and was generally regarded as a very suitable course for a race. Absence of anything in the nature of hills tended to fast times. Further, a delightful autumn day favoured the event, and a huge crowd of spectators attended.

Of 75 entrants, there were 70 starters, the large field being accounted for by the fact that the event was run on handicap lines with separate awards in each of classes. The limit man was despatched promptly at one o'clock.

The placings and actual times were:

1. H. W. Hassall (Norton), time 2h. 22m. 9s.
2. Andrews (Trump-Jap), time 2h. 53m. 54s.
3. Dinsmore (Norton), time 2h. 29m. 30s.
4. Whiteside (Scott), time 3h. 14m. 43s.

The fastest in the 250 c.c. class was W. L. Handley (O.K.); S. Wallace (Rex) was second. In the 350 c.c. class, F. Andrews (Trump-Jap) was fastest, and in the unlimited class N. P. Metcalfe (Brough-Superior) was the winner.

A Lap at 68 m.p.h.

Fastest lap was made by H. Langman (Scott), who covered a circuit at the rate of 68 m.p.h.

The following won medals by finishing within 20m. of the winner's time: Hamilton (Scott), Handley (O.K.), Hill (Douglas), Wallace (Rex), Murray (Francis-Barnett), McCleery (Scott), Sleaton (Mohawk), Mallon (Sunbeam), and Metcalfe (Brough-Superior).

EASY HALF-DAY TRIAL.

A SUCCESSFUL and well-organised half-day trial was held by the Sutton Coldfield and N. Birmingham A.C. on Saturday over a 60-mile course embracing some of the prettiest parts of Worcestershire.

The route ran through Halesowen and Stourport, then lay chiefly in the Tenbury district, finishing up at the Hundred House, Great Witley. Some 50 competitors faced the starter.

There were three observed hills, a stop and restart test, and an acceleration test; only one hill caused any trouble—Flagstaff. There were one or two patches that were decidedly greasy, which necessitated careful driving on the part of the solo men. Only three absolute failures were recorded, B. H. Cunningworth (Levis), A. R. Edwards (Levis), and T. M. Eastwood (349 A.J.S.), who attempted to take the first part too fast, got out of control, and dashed into the ditch. L. V. Bowen (249 Radco) swerved on a bit of grease, ran into the grass, but after footing cleverly recovered without stopping and carried on.

THE SIDECAR T.T.

Decision to hold Sidecar Race Next Year hailed with Satisfaction. Opinions of well-known Personalities in the Sidecar World.

AS recorded in last week's issue, there is to be a sidecar race in the Isle of Man next year. For several years motor cyclists have asked, through the columns of *The Motor Cycle*, for such a race, but of late, owing perhaps to the increase of speeds of T.T. mounts, the demand has been less insistent.

Now that a race is to be held, there are not a few who look forward to the event a little apprehensively, and during the past week three questions have been freely discussed in club and trade circles.

(1) Would such a race help the development of the sidecar?

(2) Is the sidecar a suitable vehicle to race on comparatively narrow and tortuous roads?

(3) Should three-wheeled runabouts be admitted to the race?

These three questions have been answered by well-known personalities in the sidecar world, who almost without exception are in favour of a sidecar race.

Developing the Touring Machine.

The object of all T.T. races is to help the development of the tourist machine; the Sidecar T.T. should have the same object.

Mr. J. L. Norton is not only a maker of fast touring sidecar outfits, but is a sidecar exponent himself. He knows the limits of the sidecar, if any man does, and in answer to the first question he writes:

"It (the Sidecar T.T.) will undoubtedly help development in certain directions, but the type of vehicle developed for a race over a course like the T.T. would not be the best type of vehicle for ordinary use."

Mr. F. E. Baker, of Precision fame, says: "I welcome the prospect of a proposed race as an earnest endeavour to demonstrate the present possibilities of the sidecar machine and as a means of research for future development."

Mr. C. R. Collier, of the Matchless firm, a past T.T. winner and an expert sidecarist, does not think that the race would further develop the sidecar itself, but would possibly be of some assistance as regards developments in engine design and brakes.

That such a race will tend to prove the efficiency of motor cycles in general is the opinion of Mr. L. F. Peaty, the well-known Hawker sidecar driver, which seems to be the opinion also of Mr. Frank Smith, managing director of the Clyno Engineering Co., and an expert sidecar driver of many years' standing.

Steering Important.

"I consider," he writes, "that any race such as the Sidecar T.T. must help the development of the sidecar. Engines, gear boxes, transmission, brakes, and frames would be submitted to the severest test. . . . Steering at high speeds would also have to receive special attention."

That well-known competition rider, Mr. W. B. Gibb, of Gloucester, looks to a Sidecar T.T. to eradicate the weakness of design which becomes apparent in the English or Scottish Six Days Trials.

A well-known Coventry sidecar manufacturer, Mr. W. Montgomery, who has now been making sidecars for twenty-one years, submits the view that, in spite of what theorists say, the sidecar is fundamentally sound. He agrees that a Sidecar T.T. should help its development.

Messrs. Mills-Fulford, Ltd., also old-established sidecar makers, have no doubt whatever that they could build a chassis to stand the severe test which the race will impose upon the competing machines.

As a means of exploiting the sidecar, Mr. S. L. Bailey, the Douglas exponent, welcomes the race. He writes:

"There is little doubt in my mind that the holding of a sidecar T.T. race would focus considerable attention on the sidecar movement generally, and the British section of that movement particularly, especially so at a time when the smaller light car movement is directly attacking the sidecar section of the industry.

"I think that the two markets are quite distinct, and there will ever be a big demand for a fast, light and economical outfit that will take all main road hills on top gear and at a much faster speed than the usual light car. Proof of this, of course, can only be demonstrated in such a race as the T.T., and I think the results over a mountainous and varying course like the I.O.M. T.T. circuit will surprise most people."

Our correspondents appear to be unanimous regarding the assistance the race will be in developing the sidecar. Mr. Victor Horsman, record breaker on two and three wheels, is just as certain on this point as Mr. George Brough and Mr. Osborne de Lissa, managing director of M.A.G. Engine Co., Ltd., who is not unknown as a sidecar expert on the track.

Mr. T. Watson, of Watsonian Sidecars, agrees that the race will materially influence sidecar design and development, "possibly to the good of the industry in certain respects, but adversely in other directions."

"Freakish designs will be incorporated which will be useless to the general public," he affirms. "But weaknesses will be found and improved upon. Careful thought will have to be given to brakes."

The Question of Safety.

Anyone who knows the nature of the T.T. course, with its 80 odd bends, must think of the possible danger to the competitors. Mr. George Brough says he would prefer to be the driver rather than the passenger.

Mr. Watson thinks that while the course is not ideal for a sidecar race, owing to the narrow roads and the difficulties of one competitor passing another, each rider will have the same chance.

"There can be no question that the race will be dangerous," says Mr. Victor Horsman, "but not any more so than the present race for solo machines. In the event of a crash two people will be involved, unless it is decided to carry a dead load in the sidecar."

Mr. de Lissa, to this question of danger, answers: "Most emphatically, no!" and Mr. C. R. Collier, "Decidedly no," while Mr. S. L. Bailey writes:

"I can see no reason why a sidecar should not be safe on this course. It depends entirely on the driver, which equally applies in the case of a solo rider. It would be no more difficult for sidecars to pass than for cars, and it must be admitted that there were very few accidents in the car T.T. race."

The experts of the Mills-Fulford and Montgomery firms consider that the risk of cornering should be no more than has to be taken in consideration under the usual conditions of the T.T. races. Mr. Frank Smith is of similar opinion, and considers "a properly designed sidecar quite suitable to race on narrow and tortuous roads."

Mr. W. B. Gibb thinks that manufacturers entering the race will fit flexible joints on similar lines to those used on the dirt tracks in America, and Mr. F. E. Baker believes that a sidecar can be raced over any road on which a four-wheel or two-wheel vehicle can compete.

"I certainly consider the element of danger would be greater with a sidecar outfit than either solo or four-wheeler vehicles," writes Mr. Norton on this point.

Sidecars and Runabouts.

As to whether three-wheel runabouts should be admitted to the race opinion is fairly evenly divided. Mr. W. B. Gibb thinks a mixed race would provide useful data for the buyer; Mr. W. Montgomery says: "Let 'em all come—the superior qualities of the sidecars can be demonstrated quite safely and effectively." Messrs. C. R. Collier, Frank Smith, and George Brough and the Mills-Fulford firm also agree.

The designer of Watsonian sidecars considers that it would be better to concentrate upon sidecars, and Messrs. Victor Horsman and O. de Lissa consider that the three-wheeler would have an unfair advantage.

Mr. F. E. Baker says that if the race is regarded as a development race for sidecar machines, then it should be confined to sidecars, an opinion shared by Mr. J. L. Norton and Mr. L. F. Peaty.

Letters have also been received from Messrs. W. A. Fell Smith, Harry Bashall, Geo. Grinton, J. A. Masters, F. W. Giles (A.J.S.), T. C. de la Hay (Sunbeam), F. W. Barnes (Zenith), and J. E. Greenwood (Sunbeam), and in every case these expert sidecarists agree that the race will be of great benefit to the development of the sidecar, and that in the hands of a capable driver the element of danger is not great. But Mr. W. H. Wells, of the Indian firm, is emphatic that sidecars must not be allowed to practice on the course at the same time as solo machines

LIVERPOOL'S

One particular spot on the bank had a magnetic attraction for the soloists. C. C. Wilde (499 Triumph) is making way for G. Warbink (499 Sunbeam).

"S.N.S.S." Competitors in last Saturday's Liverpool M.C. Reliance Cup Trial will dream of these cryptic letters (denoting the start of a non-stop section) for many a day.

The event appeared to be nothing else but observed sections, one following the other with bewildering rapidity, and none of them without cause. It was one of the most sporting scrambles of 1922, and it is a great pity that it should have been marred by inefficient route-marking. It was a test of hill-climbing, of controllability, and, perhaps most of all, of brakes.

That the sun shone all day did not, as sometimes happens, convert a strenuous trial into a joy-ride; rather, rain might have made it an impossibility. A very active fresh-water spring attended to the lubrication of Alt-y-Bady, and clean ascents were as rare as failures were numerous, but several of the other hills were by no means dry.

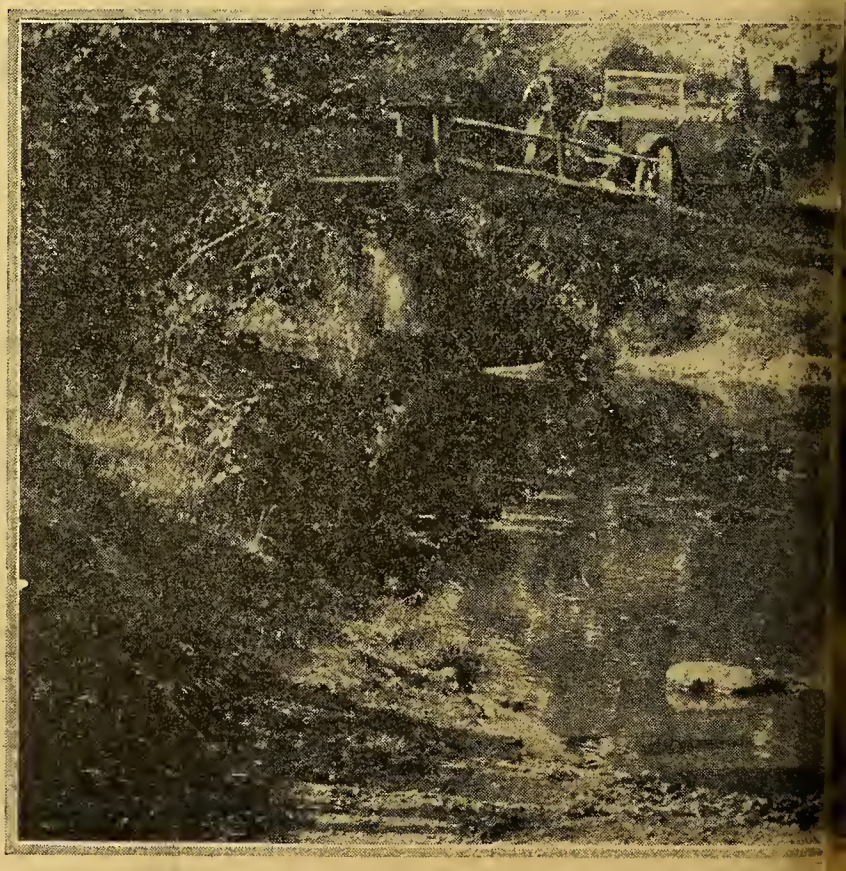
Sporting Visitors.

There was a strong contingent of sporting Yorkshiremen among the competitors, and another from the East Midland Centre clubs; neither party was disappointed.

Within a mile or two of the start at Queensferry the fun began—water-splashes, cross-gullied cart-tracks, grassy virgin paths that on a wet day would have delighted, or broken, the heart of the enthusiast, sudden turns, ascents and descents equally precipitous. Near Ffrith there was quite an ambitious ford, but it was not very deep. (Had it been more than 10 inches the regulations, thoughtfully, would have allowed the competitors to push their machines through.) The sidecars, which had to average only 18 m.p.h., against the solo 20, were first; most of them made good crossings, although one of the Brough Superior outfits was reported to have stopped, and E. Foster's lightweight Raleigh very nearly underwent an involuntary bath.

About a mile further on came Ffrith Hill, rearing up with surprising suddenness just beyond a railway bridge. The lower and steeper portion left something to be desired in the matter of surface, and loose stones caused wheel-slip with one or two of the sidecars. The first to fail was J. Taylor (633 Norton sc.); a burnt-out clutch was suspected. Then W. Roberts (800 A.J.S. sc.) stopped, baulking J. H. Green (269 Excelsior), who wobbled so badly in passing that he, too, failed. J. G. Collins, on another A.J.S. outfit, appeared to be most unhappy for the first 30 yards, then decided that he was to get up all right, which he did smiling!

The soloists were almost monotonously successful, vastly entertaining the small boys of the neighbourhood, who appeared to be most enthusiastic about "mottr pikes" (another version: "mottr picycles"). However, A. E. Musker on a 1915 Triumph came perilously near failure after several wild zigzags, and W. J. Knight (499 Triumph), appeared to have been taken by surprise at the suddeness of the climb. The other four-valve Triumph, C. C. Wilde's, made one of the best climbs of all. No one else failed. The following made the most imposing ascents: G. S. Boston (532 Scott), Miss M. Cottle (547 Powell). W. Westwood Wills (547 Powell). J. L. Fox (490 Norton), A. J. Bailey (633 Norton sc.), C. P. Wood (532 Scott sc.). J. H. Davies (492 Sunbeam), A. Bennett (492 Sunbeam), G. W. Shepherd (L.S.D. three-wheeler—with chains), G. Clapham (532 Scott), G. F. Burns (492 Sunbeam), G. L.



Although V. Horsman (Norton sidecar) himself appears quite unperturbed by this

CE CUP TRIAL.

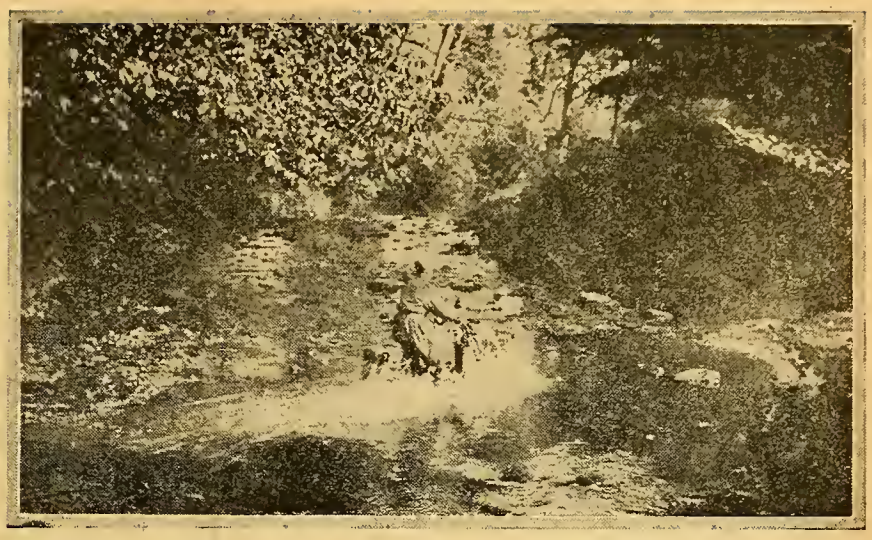
Falck (499 Rover)—curiously impressive plugging—W. J. Kellett (492 Sunbeam), L. Randles (492 Sunbeam), W. H. Hadfield (348 Raleigh), F. E. Nash (481 Scott), J. T. Waring (499 Sunbeam), D. T. Bruce (494 Douglas), and G. Clarkson (492 Sunbeam).

G. E. Barnard (678 Martinsyde sc.) was noticed paying a visit to the local smithy in the village down below; he retired here.

Llangollen was reached by way of the Old Horse-Shoe Pass, but before being allowed to lunch there the riders were sent round a merry two-mile detour among the clouds, prominently signposted "public footpath"; the Llangollen public must be a hardy race!

Then came the "Bady." One could write a volume on how to climb this remarkable hill; and attempt the task oneself next day—and fail. A low gear and two stout ribbed tyres are probably the most useful aids. Even a Scott cannot be sure of rushing it successfully.

All honour, therefore, to the four soloists who went up at speed without any suspicion of footing. They were: Miss Cottle (Powell), not *very* fast, but wonderful to watch, correcting every little skid and wobble in a masterly fashion; G. Clapham (Scott), who took the wrong turn after reaching the foot again *via* Dolywern, and made a second faultless climb, amusing everybody by innocently asking if he had not been up before; G. F. Burns (492 Sunbeam), one of the six riders in England who apparently always climb Alt-y-Bady successfully; and E. Eggers (349 A.J.S.), particularly creditable, for his gears were apparently standard.



The first soloist to cross the Cymmau water-splash—J. H. Fox (633 Norton)—demonstrated that it was not to cause much trouble.

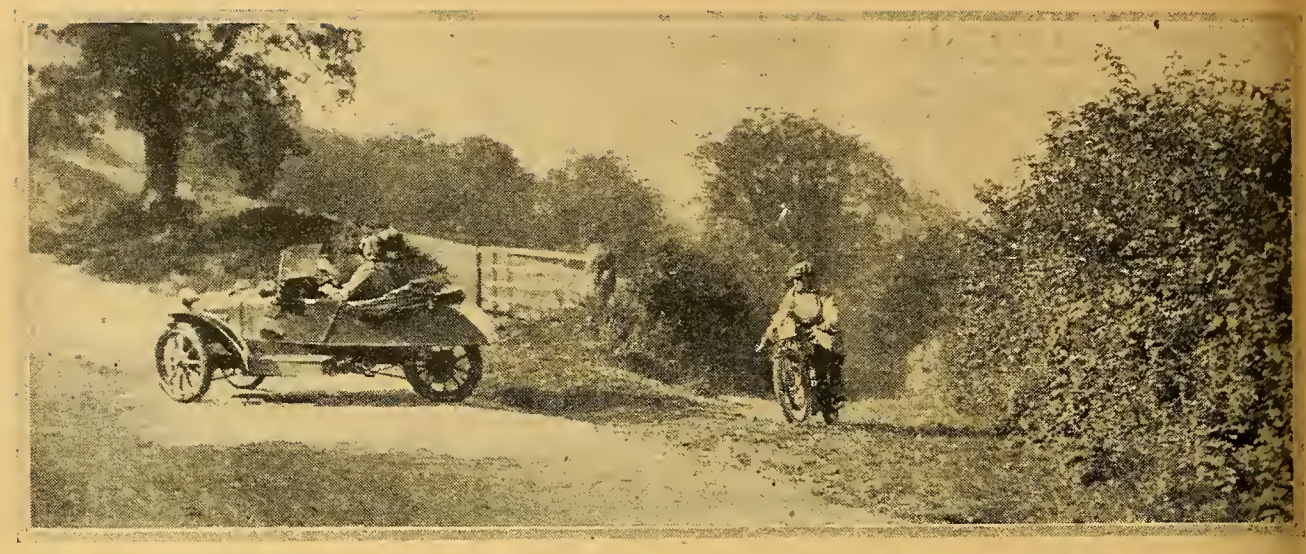
...ers to "be prepared." The water was not deep but the approach was precipitous

No marks should have been lost by: Westwood Wills (Powell), one perfunctory dig marring an otherwise exceptionally fine climb by one who is alleged to live on the hill; G. S. Boston (Scott), also fast, but touched once; E. Foster (348 Raleigh), with feet ready and occasionally touching, but non-stop; E. H. Welch (490 Norton), like Foster, but more so; G. L. Falck (499 Rover), ditto; F. H. Hawkins (348 Raleigh), ditto; W. J. Kellett (499 Sunbeam), who overtook Hawkins, but not elegantly; S. Doward (269 Sun-Vitesse), helped by an extremely low gear; L. Randles (Sunbeam), feet down, but quite good; Hugh Gibson (348 Raleigh), undecided whether to foot or not; C. H. Fox (557 B.S.A.), ready to slog, but did not touch; G. Clarkson (Sunbeam), footed most judiciously; and J. Graham Oates (248 Grindley), fast, clever, but stormy.

Problems for the Observers.

There were several bouts regarding which the verdict can only be "No decision." For example, Alec Bennett brought an I.O.M. Sunbeam up at great speed, and was regarded as likely to make the star ascent of the day until he "found" both banks in rapid succession; whether he stopped long enough to fail is doubtful. A. R. Evans (Sunbeam) repeated Bennett's performance in a minor key; J. H. Green (269 Excelsior) stopped with a spinning wheel, but got going again unaided; and W. H. Hadfield (348 Raleigh) received unnecessary outside assistance.

There is no need to enumerate all the solo failures—merely to charge the bank was too frequent a happening to interest much—but one or two were either more spectacular or quite instructive. For instance, P. G. Thomason (398 A.J.S.) skidded on a bone-dry slab of rock, presumably because his tyres were wet and slippery; J. H. Davies (492 Sunbeam) deserved a better fate than the bank; so did C. C. Wilde (499 Triumph) and G.



G. W. Shepherd (L.S.D. three-wheeler) leading A. Bennett (492 Sunbeam) into the main road immediately after the worst watersplash.

Warbink (Sunbeam), who were both hampered by a stationary sidecar; J. H. Simpson (349 A.J.S.) pirouetted broadside without any apparent provocation on his part and restarted without difficulty; and G. A. Clarke reared his Sunbeam vertically up the bank.

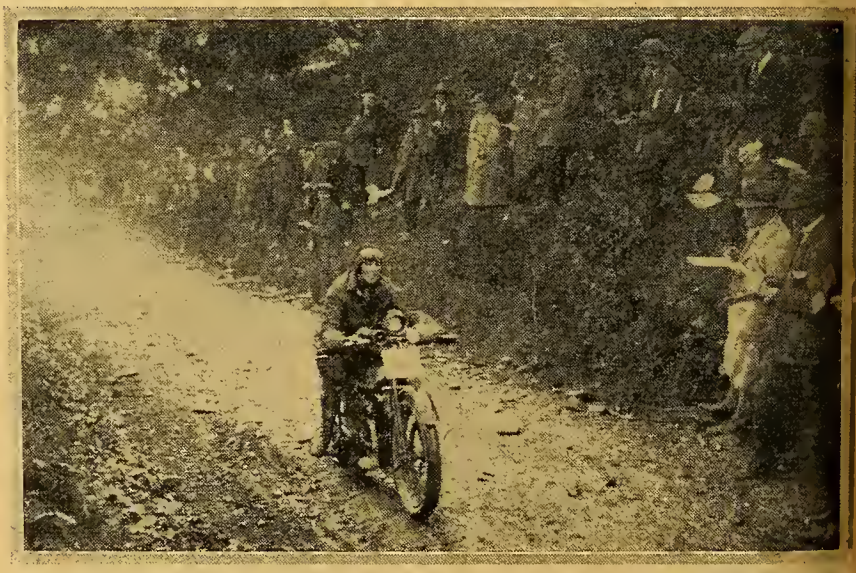
There were 18 passenger machines, but only four got up non-stop at first attempt. In the cases of C. P. Wood (Scott sc.) and V. Horsman (Norton sc.) their passengers wriggled nearer the carrier than was in order, but it would have been quite excusable had not Reg Brown (Sunbeam sc.) shown that it was unnecessary. G. W. Shepherd (L.S.D. three-wheeler) was the fourth and last to get up non-stop; he used Parson's chains. C. Bingham (Enfield sc.) was absolutely baulked, but eventually after one or two further abortive attempts came up in great style.

When the last man had failed on Alt-y-Bady the spectators went their ways, obviously thinking that the difficulties of the trial were over. It was a mistaken idea. Dol-y-wern, Conquering Hero, Glyn-Arthur, Afonwen, and particularly Bodfari are hills of the first order, hills that, could they be bodily moved to Kent, would cause more consternation than the notorious Rook.

The writer makes this claim without prejudice. Yet there were very few failures; even Bodfari, steeper than 1 in 3 with huge rocks and loose sand, caused only H. J. Drury (A.J.S.) and Graham Oates (Grindlay) to go on the observer's sheet as having failed, and A. E. Musker (550 Triumph) as having run alongside.

Interspersed with these formidable climbs were equally formidable descents and more rough and tortuous mountain tracks. Fortunately the route marking took a turn for the better here. Spills were common. Shepherd's L.S.D. overturned near the top of one mountain, and the later men had to take a detour round the base in consequence. The Scott sidecar chassis broke. Clapham took a nasty toss by hitting a gulley at speed, and a Douglas rider was rather seriously hurt.

Keeping to schedule was a hard task in itself, and the omission of the restarting test on Pen-y-Ball should not cause any ties for the premier awards.



Quite the star ascent of Alt-y-Bady was made by the only lady competitor, Miss Cottle (Powell), who earned the applause of the spectators.

BELGIAN RECORD ATTEMPTS.

FINE weather favoured the attempts at records, organised by the Belgian Motor Cyclists' Federation, which were made on the magnificent surface of the Oostmalle road. These attempts were made over the flying kilometre in two directions. The average speeds are given below:

MOTOR ASSISTED BICYCLES.—Joncret (125 Tordor), 25.6 m.p.h. (Belgian record).

250 C.C. SOLO.—Claessens (F.N.), 63.54 m.p.h. (Belgian record); Cravillon (Rush-Blackburne), 61.12 m.p.h.; Vermeulen (Griffon), 38.96 m.p.h.

350 C.C. SOLO.—Remington (Rush-Blackburne) and Claessens (F.N.), 76.5 m.p.h.; Philippart (F.N.), 73.90 m.p.h.

500 C.C. SOLO.—Rossi (Motosacoche), 90.20 m.p.h. (Belgian record and fastest time of the day); Defer (Norton), 75.25 m.p.h.; Vidal (Saroléa), 63.91 m.p.h.

750 C.C. SOLO.—Breslau (Norton), 77.13 m.p.h. (Belgian record).

1,000 C.C. SOLO—Bouillon (Indian), 89.47 m.p.h (Belgian record); Piérard (Indian), 86.5 m.p.h.

350 C.C. SIDECARS.—Delvigne (Rush-Blackburne), 62.13 m.p.h. (Belgian record); Philippar (F.N.), 60.45 m.p.h.; Reynaertz (Gillet), 58.5 m.p.h.; Berry (Sheffield-Henderson), 57.35 m.p.h.

600 C.C. SIDECARS.—Defer (Norton), 66.6 m.p.h (Belgian record).

1,000 C.C. SIDECARS.—Milhoux (Indian), 75. m.p.h. (Belgian record); Springuel (Harley-Davidson), 72.5 m.p.h.

TRYING CUMBERLAND TRIAL.

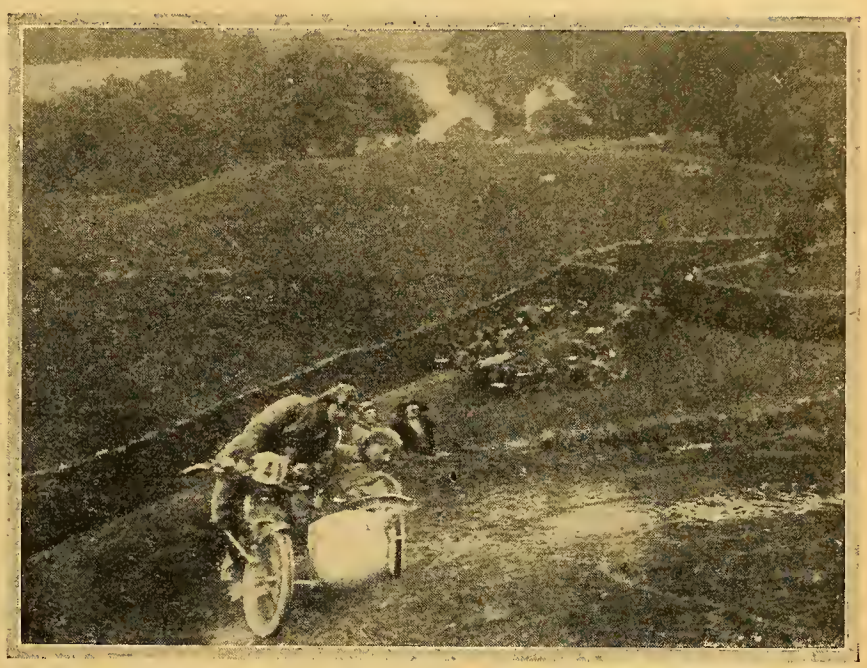
Cumberland Club's Sporting Event in the Lake District.

IN foul weather and fair, mostly the former, the Cumberland Club has held numerous sporting trials during the present year. The last of the competition season, organised by the Western Section, was held on the 7th inst. over a course that had some new and novel features.

The course was good, and very few marks were lost before the luncheon stop was made at Workington. On the way thither the slimy slope of Whinfell from Lorton Vale caused a few adventures, and W. Tweddle (550 Triumph) failed owing to a wide skid; D. H. Watson (Morgan) also slid into the grease. Between Branthwaite Brow top and Workington, T. B. Westmorland (Harley-Davidson sc.) unfortunately suffered a puncture, and arrived five minutes late, yet five minutes earlier than Goddard (770 B.S.A. sc.), who had similar trouble.

After the re-start excitement soon became fast and furious. Certainly, many stuck fast and most were furious in the bog of "Muddy Avenue," on the Branthwaite-Dean portion. This new and surprising "colonial section," so-called, was two miles long and six to eight inches—some said two feet—deep in mud and water. Every rider was late at the end of this section.

The once-trying Buttermere Hause was surmounted in capital style, but the crossing of Rake How, between Naddle Vale and the Vale of St. John, shattered the hopes of many. Neither sun nor wind had been present to dry the two greasy corners, and in consequence there were many thrills. The solo machines were all successful, and very noticeable were the skilful ascents by L. and J. Edmondson on Massey-Arrans. Remarkable acrobatic feats were performed by sidecar passengers, and several required assistance. The lighter outfits were most successful, notably, A. D. Reid on a 349 c.c. A.J.S. For the spectators, the tit-bit of the day was the attack by Parry (Morgan). The first corner was taken at high speed, but on the second, owing to a sharp skid, the driving chain jumped off the sprocket. There was sudden collapse and the machine almost dashed back over the edge, but immediate help was forthcoming. But for this, Parry would have won the passenger class.



An anxious moment on the slippery bend of Rake How Hill. The rider is J. Casson (550 Triumph sidecar).

On Robin Hood Hill, near Bassenthwaite, three riders charged the bank, including the secretary, J. P. Bennett (499 Sunbeam). The final feature was the last mile run to Castle Inn at the speed of four miles an hour, which was accomplished quite easily.

The winners in the various classes were:—

BEST PERFORMANCE OF THE DAY (N. H. Richmond Cup).—L. Edmondson (349 Massey-Arran).

HEAVYWEIGHT SOLO CLASS.—G. Guinness (499 Sunbeam).

PASSENGER CLASS.—H. Dixon (Rover Ic.).

LIGHTWEIGHT SOLO CLASS (F. R. Anderson's Cup and Gold Medal).—Leslie Edmondson (349 Massey-Arran).

RECORD ACTIVITY AT BROOKLANDS.

AT this time of the year there is usually a veritable epidemic of records at Brooklands. Such has been the case during the past few months. Nortons, as usual, and Harley-Davidsons and Douglas machines have been well to the fore, while a motor cycle not often seen on the track in record attempts—the 749 c.c. Bradbury—has recently acquitted itself well.

Wednesday of last week (October 11th) witnessed the fall of no less than nine records through the activity of four riders on three machines. R. N. Judd (490 Norton) broke the following Class C (500 c.c.) records, which also cover Class D.:—

100 miles. 1hr. 20m. 46.64s. = 73.88 m.p.h.
2 hours. 147 miles 1,261 yards = 73.86 m.p.h.

C. F. Temple and F. Allchin (998 Harley-Davidson sc.) gained the following Class G (1,000 c.c.) records:—

50 miles. 40m. 36.59s. = 73.87 m.p.h.
100 miles. 1hr. 23m. 57.12s. = 71.47 m.p.h.
1 hour. 73 miles 1,018 yards = 73.58 m.p.h.

R. E. Dicker (749 Bradbury, standard V-twin side-by-side valve) also broke the following Class D (750 c.c.) records on that day:—

200 miles. 2hr. 55m. 58s. = 68.19 m.p.h.
300 miles. 4hr. 41m. 23.87s. = 64.02 m.p.h.
3 hours. 204 miles 1,417 yards = 68.26 m.p.h.
4 hours. 271 miles 1,350 yards = 67.94 m.p.h.

The tank burst within three laps of the end of the 300-mile record, but Dicker continued for nearly two laps, when he completely ran out of petrol. He dismounted, pushed the machine to his depôt, filled up and carried on with the fuel streaming out in all directions. As he approached the timing box Mr. Ebblewhite signalled that the 300 miles had been completed in record time. Dicker pulled up and, as he stopped, the petrol burst into flames and the machine lay burning in the centre of the track. A number of Pyrenes were turned on the fire and the blaze extinguished.

DOT DEVELOPMENTS.

THE Dot motor cycle has been known for many years, especially in the North of England where it is made. In future it is highly probable that more will be heard of it, since a new company has been formed to exploit it. For 1923 Dot Motors, Ltd., will have a comprehensive range of models, which will be at Olympia next month. These include:—

293 c.c. J.A.P. engined lightweight, with three-speed gear and clutch, selling at £65.

346 c.c. sports model, with special J.A.P. engine, three-speed gear and clutch, £78.

976 c.c. big twin sports model, with close ratio three-speed gear box, £140.

976 c.c. sidecar outfit, £130.

CURRENT CHAT (continued from p. 551).

"The Motor Cycle" 3d.

With this issue the price of *The Motor Cycle* reverts to three-pence.

Next Year's Grand Prix.

Possible venues for the 1923 Grand Prix are Lyons or Strasbourg, which was used this year.

Enthusiasts from the North.

Are North Country riders keener and more capable than those of the South? The suggestion has been made in *The Motor Cycle* before, and last Saturday's Reliance Cup Trial seemed to add weight to the idea.

Census-Taking by Our Readers.

In response to a small paragraph recently, many readers have taken a census of motor cycle traffic in various areas, showing the most popular makes. We hope to publish a representative selection next week.

D.R.'s Reunion Dinner.

It is hoped to arrange a reunion dinner during show week of the 1st and 5th Division and Abbeville L. of C. ex-D.R.'s. Mr. B. F. G. Fowke, c/o Trooms, Edwin Road, Twickenham, is attending to the organisation, and can be reached by telephone : Richmond 2667.

Novelty in Trials Next Year.

Preliminary arrangements have been made by the Worcester and District M.C.C. and the affiliated motor club to hold a "Selling Trial" next spring. It will be on the lines of a horse race selling plate, and only standard machines will be eligible. An open permit will be sought. Further details will be given later.

Huge Fields at Brooklands.

Everybody who is anything in the racing world will compete in next Saturday's Championship meeting at Brooklands. Nearly sixty entries have been received for one race.

For the Hospitals.

An anonymous donor has presented six McKenzie motor bicycles to the Prince of Wales' Day collection for the hospitals. It is possible that these will be put up to ballot.

New A.C.U. Centre.

Club activity in the Bristol district has now been given a firm foundation by the formation, already announced in *The Motor Cycle*, of a new A.C.U. Centre, to be known as the Wessex Centre. A large and representative gathering was present at a meeting held at the Old Red House, Bath, when a strong board of club representatives was selected.

Imports and Exports.

An increase in the importation of motor cycles is shown for September, but compared with the figures of 1920 their value is extraordinary low.

IMPORTS.

	1920	1921	1922
Value of machines ..	£6,325	£21,448	£410
Value of parts	£16,449	£15,043	£3,643
Total	£22,774	£36,491	£4,053

Unfortunately a decrease of nearly £20,000 is indicated in the export figures for last month when compared with August, and more startling still are the figures when contrasted with September, 1920, when we exported £291,273 worth of motor cycles and parts. Compared with September last year, however, the figures are well maintained.

EXPORTS.

	1920	1921	1922
Value of machines	£227,745	£34,747	£30,80
Value of parts ..	£63,528	£18,841	£21,30
Total	£291,273	£53,588	£52,10

CLUB NEWS (continued from p. 550)

Aberdeen and District M.C.C.

Annual speed trials were held on Cruden Bay sands on the 7th inst., and some fine riding was witnessed by a large crowd. Mr. George Davidson, manager by a large crowd. Results were as follows:—

CLASS 1 (UNLIMITED, HANDICAPPED IN CLASSES—Mr. P. W. Smith's Challenge Cup).—1, A. Brown (490 Norton); 2, R. Dempster (499 Triumph); 3, W. Cheyne (492 Sunbeam).

CLASS 2 (UNLIMITED, HANDICAPPED IN CLASSES, EXPERTS BARRED).—1, W. Cheyne (492 Sunbeam); 2, G. Cumming (494 Douglas).

CLASS 4.—350 c.c.—1, G. Ferries (349 Massey-Arran).

CLASS 5.—560 c.c.—1, A. Brown (490 Norton); 2, R. Dempster (499 Triumph); 3, W. Cheyne (492 Sunbeam).

SPECIAL PRIZE FOR FASTEST TIME.—A. Brown (490 Norton).

Bristol M.C. and L.C.C.

A stiff event held on the 7th inst. over a 28-mile course to be covered twice, the Walters Cup Trial, included East Dundry and Burledge Hills on both circuits. No non-skid devices allowed. Much of the course and the hills were in a very treacherous condition, and of the 25 starters only 13 finished; Burledge proved the chief obstacle, and only 5 clean solo climbs out of 18 attempts were recorded, and only 1 sidecar out of 13 succeeded in getting up without assistance—F. Cooke's Sunbeam outfit. The results were:

1, Walters' Challenge Cup and Gold Medal, F. A. Simpson (346 Francis-Barnett); no loss on time, and clean climbs of Burledge on each circuit.

2, Silver Medal, Stanley Gill (269 New Imperial); no loss on time, and one clean climb of Burledge.

3, Bronze Medal, E. C. Collins (490 Norton); 1 mark lost on time, and one clean climb of Burledge.

Special Amateur Prize, W. Le Brun (499 Rudge) solo, Bernard Allen (499 Triumph) tied; no loss on time, failed Burledge both times.

Barrow and District M.C.

Results of the reliability trial for the Fisher Cup are now to hand, and are as follow:

1. G. D. Barker (799 A.J.S. sc.), winner in 1920.
2. J. C. Dearden (490 Norton).
3. J. Morrison (498 P. and M.).

Birmingham M.C.C.

Open to all members of Midland Centre A.C.U. clubs, a sporting half-day trial has been arranged by the above club to take place on Saturday next. Nine hills and four watersplashes will be included in the route, while there will be tests of silence, acceleration and braking.

Week-End Club Events.

Oct. 20th.—Cumberland County M.C.C.—Lecture.
Oct. 21st.—Reigate, Redhill and District M.C.C.—Short Night Trial.
Oct. 21st.—Essex County and Southend A.C.—Speed Judging Competition.
Oct. 21st.—Coventry Triangle M.C.—Circular Run.
Oct. 21st.—Bristol M.C. and L.C.C.—Six Hour Trial.
Oct. 21st.—Birmingham M.C.C.—Sporting Half-day Trial.
Oct. 22nd.—Coventry Triangle M.C.—Run to Temple Balsall.
Oct. 22nd.—Doncaster and District M.C.C.—Run to Dukeries.
Oct. 22nd.—Sheffield M.C.C.—Run to Cresswell Crags.
Oct. 22nd.—Halifax and District M.C. and L.C.C.—Run to Ashopton.
Oct. 22nd.—Rochester, Chatham and District M.C. and L.C.C.—Run to Hawkhurst.
Oct. 22nd.—Bradford M.C. and L.C.C.—Speed Trials.

Ulster M.C.C.

Amended results for one class of the Autumn speed trials at Magilligan Strand reach us as follows:

TEN-MILE HANDICAP (350 c.c.).

1. H. Chamber (349 A.J.S.).
2. D. M. Hunter (349 Massey-Arran).
3. W. C. Hunter (348 Hunter).

Guernsey M.C. and L.C.C.

An excellent afternoon's sport was provided for members by a hill-climb held on the 5th inst. The hill selected was that from Fermain Bay to St. Martin's Road, and, despite the slippery nature of the surface on the lower part, some good times were registered. Sidecar drivers experienced little difficulty at the upper hairpin, but three solo riders collided with the wall. Mrs. Mauger, a lady competitor, made several neat and faultless climbs. The fastest ascent was made by E. Bougourd (550 Triumph), his time being 1m. 8⅗s.

The competitors and their times were as follows:—

SMALL SOLOS.—L. Hill (225 Enfield), 1m. 41⅘s. (winner); C. Thorne (269 Coventry Eagle), 1m. 42⅗s.; J. Tullier (293 Calthorpe), 2m. ⅕s.

SECOND SOLOS.—L. Brehaut (349 A.J.S.), 1m. 22s. (winner); K. Bell (348 Douglas), 1m. 39⅖s.

MEDIUM SOLOS.—P. Mauger (548 Blackburne), 1m. 35⅖s. (winner); S. P. Peek (494 Douglas), 1m. 36⅗s.; T. Le Cheminant (293 Coventry Eagle), 1m. 43s.; Mrs. P. Mauger (548 Blackburne), 1m. 43⅗s.

HEAVYWEIGHT SOLOS.—E. J. Bougourd (550 Triumph), 1m. 8⅖s. (winner); R. Genge (Alldays), 1m. 12⅗s.; H. W. Prins (557 B.S.A.), 1m. 42⅕s.

LIGHT SIDECARS.—A. Gorman (550 Triumph), 1m. 46⅘s. (winner); H. Slatror (550 Triumph), 2m. 32s.

HEAVY SIDECARS.—G. Lihou (654 Quadrant), 1m. 39⅖s. (winner); E. De Putron (633 Norton), 1m. 41⅕s.; A. De Carteret (633 Norton), 1m. 46⅗s.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp) and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

RELATING TO HAND STARTER MAGNETOS.

In your publication, "Magnetos," by A. P. Young, A.M.I.E.E., on page 181 is a diagram for a hand-starter magneto, the firing point of which is shown on the cylinder next behind the one which would be normally fired by the magneto proper. Would you kindly inform me if this is correct, as it seems to me it should fire on the same cylinder, but some few degrees behind the ordinary point.—C.J.D.

The drawing is quite correct. In order to prevent all chance of backfire, it is necessary to make the auxiliary distributer arm for starting some 30° or so behind the main arm. In the case of an eight- or twelve-cylinder engine this makes it appear that the trailing point is connected to the wrong cylinder, but actually it will have moved on by the time the actual sparking moment occurs; on a four- or six-cylinder engine the illusion would not be apparent, as there would be a much greater space between the distributer segments.

MORE SPEED NEEDED.

On a 1922 two-stroke Sun-Vitesse the most I can do is 30 to 35 m.p.h. Surely something is wrong? Could you suggest anything which would cause it to be so slow? Would a larger jet make any difference to the speed? (I believe it has a 24 jet in now.) H. G. B.

A slightly larger jet would no doubt improve the speed a little, but it might be necessary to provide some means for admitting extra air also, if you wish to keep the consumption within economical limits. The magneto timing should be fairly well advanced. Make quite sure that the contact breaker points are breaking when the piston reaches top dead centre with the magneto control fully retarded. It is difficult to tell you of any simple way of tuning up for speed—there is no one thing which you can do that can be guaranteed to increase the speed of the machine; every little point must be seen to, and everything must be in perfect working order, otherwise you cannot get the best results. Your best plan is to obtain a copy of "Two-stroke Motor Cycles," and having read it carefully make quite sure that your machine is in the best possible mechanical order. The best results the engine is capable of giving should then follow naturally. Your machine should certainly attain 40-45 m.p.h.

Important Dates.

Sat., Oct. 21st—Cheshire Centre A.C.U. Open Reliability Trial.

Sat., Oct. 21st—B.M.C.R.C. Championship Meeting at Brooklands.

Fri., Nov. 3rd, to Sat., Nov. 11th—Olympia Car Show.

Sat., Nov. 25th, to Sat., Dec. 2nd—Olympia Motor Cycle Show.

Tues., Dec. 26th, and Wed., Dec. 27th—M.C.C. London-Exeter Run.

Sat., Jan. 13th, to Wed., Jan. 24th (1923)—The Belgian Salon.

Fri., Jan. 26th, to Sat., Feb. 3rd (1923)—Scottish Motor Show.

PERPETUAL MOTION!

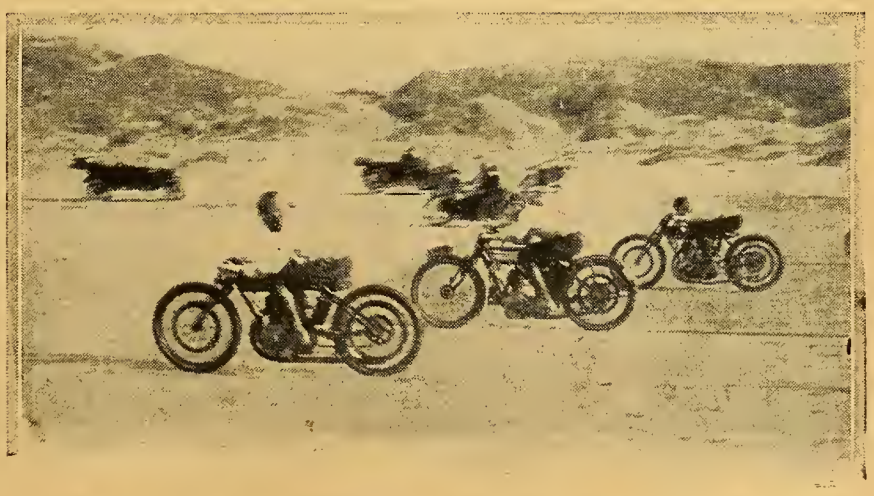
I am thinking of setting up a dynamo lighting and charging plant, with a dynamo of 20 volts 6 amps output. If I used two of these dynamos, would one drive the other without an engine? Would the first dynamo make enough current to drive the second, and also leave, say, about half the current for the lighting, etc.? What voltage accumulators should I want? Should special switches be used? Would belt-drive be suitable?—R. J. N.

Your questions are not at all clear, and it would appear that you have insufficient knowledge of electrical apparatus to proceed without more complete instruction on the subject. You cannot use one dynamo to drive another in the way you suggest. A dynamo must be driven from some external source of power, and you cannot use the dynamo itself to provide that power for obvious reasons. We think your best plan is to obtain some simple elementary text book on electricity before proceeding further

CARE OF ACETYLENE GENERATOR.

My acetylene lamp (separate generator) gives a splendid light for a short time; then the flame drops from a broad fishtail to a mere glimmer; the rear lamp is also fed from the same generator, which personally I believe to be too small. Do you think this likely?—H. S.

If the generator is kept perfectly clean, and if there is no leakage at any of the joints, the strength of the flame should



SPEED TRIALS AT SOUTHPORT. At the North Liverpool M.C.C. event on the sands: F. E. Marsden (492 Sunbeam), G. E. Cowley (490 Norton), and D. Swift (492 Sunbeam) in an exciting triangular duel.

be maintained for the greater part of the duration of the consumption of the charge. It is advisable to remove any filtering pads which may be fixed in the generator, as if these become soaked with moisture they are apt to cause the trouble you describe. If the generator was the one supplied with the lamp it should give good results, and we think it is only a matter of making sure that the generator is properly cleaned and charged, and also that there is an even flow from the water valve.

IN HALF-MILE STAGES.

[?] A 1913 499 c.c. Triumph on which I recently fitted a new Amac carburetter, runs well for about half a mile on a 34-jet and then commences misfiring. I then have to take out the plug and clean it, after which it goes on as before. I don't think it is the plug which is at fault. The engine also runs excessively hot, although tappet clearances seem all right.—K.W.

You do not give very complete details, but as the engine commences to run again after cleaning the plug it would appear that the trouble is due to excessively rich mixture. You do not say whether the plug is covered with soot after the misfiring has occurred; if it is, it is conclusive evidence that the jet is too large or that insufficient air is admitted through the carburetter. We assume, of course, that the engine is receiving a sufficient supply of oil.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

"D." (Durham).—499 c.c. Dunelt sidecar; 654 c.c. Quadrant and sidecar: reliability, running costs, hill-climbing, suitability for poor road surfaces.

"J.S.B." (Liverpool).—733 c.c. Douglas and sidecar.

"J.D." (Peebles).—698 c.c. Raleigh flat twin sidecar: speed, hill-climbing, fuel consumption and silence.

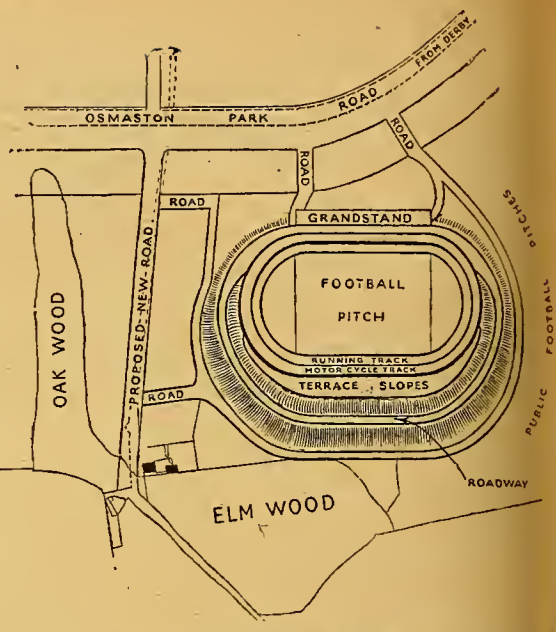
"A.J.D." (London).—550 c.c. Triumph: additional silencing arrangements.

"I.J.C." (Wimbledon).—293 c.c. Connaught: fuel consumption, speed, suitability for tall rider, Grado gears for same or similar machine.

"M.J." (Manor Park).—499 c.c. Rudge-Multi and 398 c.c. A.B.C.; petrol consumption (with and without pillion passenger), maximum speeds, and comfort.

"A.S.D.C." (Perth).—976 c.c. Morgan (Popular model), air-cooled J.A.P. engine; accommodation for two adults and child, and wear of rear tyre.

"T.W.P." (Southampton).—Possibility of fitting semi-automatic or mechanical lubrication system to 499 c.c. Triumph; also general information.



DERBY THREE-LAP TRACK. Work on the new race track and sports ground at Derby is steadily advancing. The plan of the site is here clearly shown. Terraced slopes form a natural grandstand, the grandstand proper being not yet commenced. The motor cycle track gives three laps to the mile and is banked for 80-90 m.p.h. It is situated just outside Derby near the Osmaston Road tram terminus.

A Royal Motor Cyclist.

H.R.H. Prince Aimone of Savoy is the enthusiastic rider of a four-valve Triumph.

Found.

On Gravelly Hill, Birmingham, a kick start sprocket wheel with plated dome.—Ref. No. 109.

Popular Tyres in France.

Hutchinson tyres triumphed in the recent international speed trials held in the Bois de Boulogne, Paris, as every class winner used them.

Gliding as a Side Line.

Having made a careful study of the subject of gliding, the Plus-One Sidecar Co., 62, Chalk Farm Road, London, N.W.1, is prepared to construct gliders or offer technical advice to those interested.

Dutch Club Championship.

An amendment of the results of the recent club championship trial in Holland reaches us. It is to the effect that the trade team prize has now been awarded to the Indian team.

New Address.

Owing to increase in business, the T.O.M. Co., Ltd., specialists in camping equipment, are moving into larger premises at 61-62, Newman Street, London, W.1. Telephone: Museum 8318.

Olympia Show Publicity.

Publicity arrangements for the Motor Cycle Show have been taken over by A. H. Clackson, Ltd., 199, Fleet Street, London, E.C.4, while Mr. Laurence H. Cade will occupy the position of Press representative.

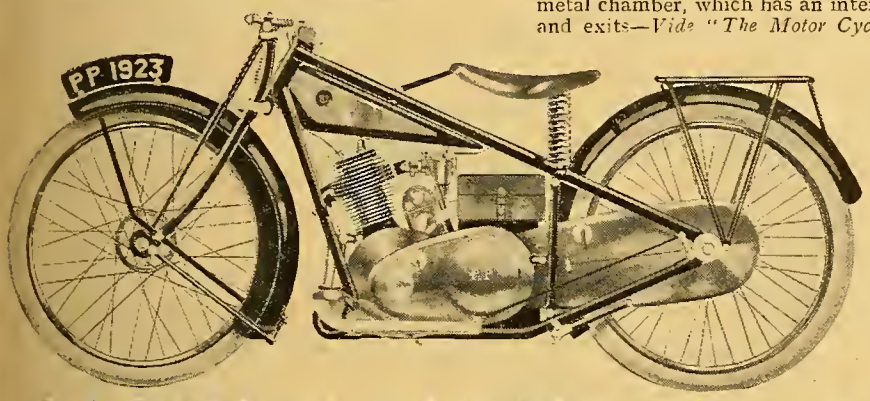
OCTOBER SUNSHINE. In the crisp Indian summer days of the late autumn there is no keener pleasure than a brisk run through the lanes, with the low October sun painting long shadows on the glowing road surface.

The P. & P. Motor Cycle

"The Silent Three."

A SERIOUS attempt to Eliminate Noise and to provide Protection.

A 350 c.c. Barr and Stroud engine is employed as the power unit, and, as is well known, the absence of poppet valves renders it particularly free from mechanical noise, while its power and reliability have already been proved. In addition, special precautions have been taken to render the exhaust as quiet as possible, and we may state, from experience with the preliminary experimental machine, that the designers have already met with considerable success, though the latest model, which will be exhibited at Olympia, will have further improvements in the silencing arrangements. First of all, the exhaust is led to a large aluminium expansion box, thence to a second sheet-metal chamber, which has an internal division and carefully designed inlets and exits—*Vide "The Motor Cycle."*



STAND 146 OLYMPIA.

We will give you further details about the P. & P. in future issues of "The Motor Cycle."

PACKMAN & POPPE, Moor St., COVENTRY.

The PROGRAMME of the SUN COMPANY

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable ____ & Co. to ILIFFE & SONS Ltd., and crossed ____ Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," Dorset House Tudor Street, London, E.C.4. *Readers who reply to Box No advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6 and on all transactions over £100, ½%. All deposit letters are dealt with at Dorset House, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

A.B.C., latest models produced by the Sopwith Aviation Co., Ltd.; new Standard model, £74; dynamo model, £88; only a few remaining.—Maudes', 100, Great Portland St., London. [7398

THE SIGN OF GOOD SERVICE

An Upheaval in the West.

The House of Godfrey's is in a state of Siege. Decorators are scaling our walls and clinging to our ceilings. Ladders and trestles cumber the floors of our showrooms, and our basement is thronged with (1922 model) refugees.

To sum up, we are preparing for the invasion of the 1923 models, and are in the mood to accept very low prices for our present end of season stock.

We give below three selected bargains available this week. For others, equally attractive, we refer you to our full list, which will be sent on request.

Or, better still, call and inspect the machines without delay—as at the greatly reduced prices we are prepared to accept, our stock will soon be cleared.

During **Godfrey's Upheaval Sale,** any visitor from the country may claim as a further reduction his travelling expenses to London.

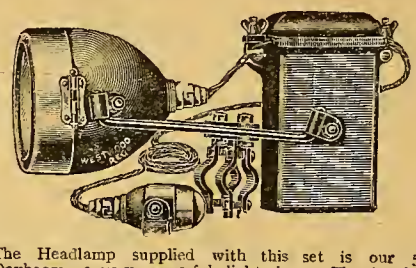
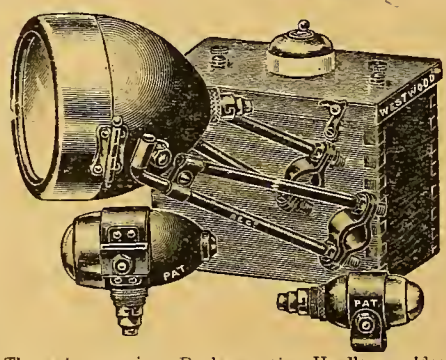
"DAYBEAM" Electric Solo Set



The Headlamp supplied with this set is our 5in Daybeam, a very powerful light-giver. The brackets are of exceptionally strong and handsome design. They carry the headlamp and also the (die cast) aluminium case. The accumulator is specially made for motor cycle lighting, and will brilliantly illuminate the head and the rear lamp for 20 hours if used intermittently. The tail lamp (our torpedo S.B.C.) is exceptionally strong and well made, and has a very attractive appearance. Each lamp is fitted with a switch, and one lamp may be used independently of the other. The outfit is despatched completely assembled, and 4 volt bulbs are fitted. The finish is ebony black and nickel plate.

Complete Outfit, List No. 30/1, Price £5 5 0

"DAYBEAM" Combination Set



The set comprises Daybeam 7in. Headlamp, Idea Sidecar Lamp, and Torpedo S.B.C. Tail Lamp Each lamp is fitted with an indepeadent switch, and is finished in ebony black with nickle-plated relief. The accumulator (capacity, 6 volt, 40 amp.) is specially made for motor cycle lighting, and will give very satisfactory service in use.

Complete Outfits, List No. 30/2, Price £7 7 0

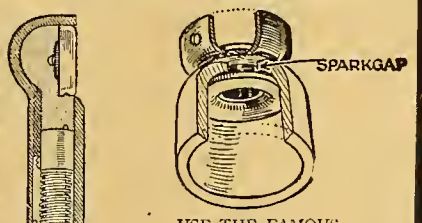
PREVENT TROUBLE

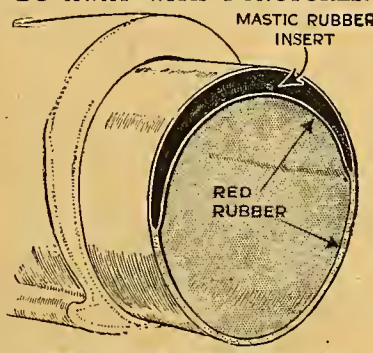
CUT OUT MISFIRING.



USE THE FAMOUS
SPARXEKAS
SPARK GAP.

Will fit any plug and make it fire even if oiled up. A most desirable fitment. It incorporates a waterproof hood. 2/6 each post free.
Sparxekas quick detachable shock-proof Terminal, 2/-.
Sparxekas with hood, 4/6.

DO AWAY WITH PUNCTURES.



USE CHALLENGER PUNCTURE SEALING INNER TUBES.
Practically indistinguishable from the ordinary old-fashioned tube. Absolutely pneumatic throughout, contain no messy or sticky substances. The only difference from an ordinary tube is that the tread portion is very slightly thicker and is built of three layers so adjusted as to be self-sealing; the centre layer being composed of the patent hole-proof composition, which instantly closes up when the nail or article causing the puncture is withdrawn. Made in all sizes for motor cycles.
MOTOR CYCLE SIZES—24×2, **14/3**; 24×2¼, **15/-**; 26×2¼, **15/3**; 26×2⅜, **16/9**; 26×2½, **18/-**; 26×3, **18/6**; 28×3, **£1 0s. 3d.**; 650 65, **£1 0s. 9d.**; 700×80, **£1 1s. 6d.**
Packing and Carriage Free.

IS YOUR SADDLE DEFECTIVE?

Why trouble to repair a saddle when we can supply serviceable and complete Second Hand Saddles by the best makers at prices ranging from **7/6** to **30/-**?

TYRE PRICES ARE DOWN.—We have fresh stocks at the latest reduced prices. Our 1922 stock is to be cleared. Send for list of Real Bargains in shop-soiled Covers and Tubes. You can save money.

ONTINENTAL Ignition Repair Co. We repair Continental magnetos only. By specialising on ., Bosch, Eisemann, Mea, Splitdorf, Dixie, and ing magnetos, we can naturally give you better ice. Prices, rewinding, 18/-; condensers, 10/-; num screws (Bosch standard), 6/-; remagnetising, slip rings, 6/6; H.T. terminals, 4/6. Our price verhauling a motor cycle magneto ranges between and 35/-, and never exceeds the latter figure. aranteed for 12 months, and re-despatched to you days.—Continental Ignition Repair Co., 13, Hard-Rd., Chiswick, London. [6603

20% POWER INCREASE. This is what the new pattern cylinder gives a 2¾ h.p. Douglas. It has streamlined ports, and large radiating fins. My price per pair is only **£5.** Fit them to any old model Douglas and you'll really be surprised.

Improved Cylinders for 4 h.p. Douglas, with detachable heads, so that you can decarbonise, etc., without dismantling your engine, and which give 20% more power, **65/-** per cylinder.

ADDITIONAL POWER may be obtained by fitting Special Lightweight Radiated Pistons, fitted with patented twin rings. They are simply wonderful, and every mail brings testimonials from all classes of satisfied riders. Price **29/-** per pair, complete with gudgeon, twin rings and copper caps.

PATENTED TWIN RINGS. The only really gas-tight and frictionless ring. Thousands have already been sold and not a single complaint. For 2¾ h.p. Douglas **1/6** each: 4 h.p. Douglas, Sunbeam, Humber, and Rover 77m/m bore, **1/8** each. B.S.A., Triumph (pre 1919), Rudge (pre 1921), Singer, New Hudson 3½ h.p., Precision 3½ h.p., L.M.C., 4 h.p., 85m/m, **1/9** each. Other makes quoted for on application.

WHY SUFFER BROKEN VALVES? My valves are guaranteed 12 months not to break, scale, or burn, and never really need grinding in. They cost more, but the best is the cheapest in the long run. 4 h.p. Douglas **10/-**. 2¾ h.p. Douglas **9/-**, complete with special spring, collar and cotter. Other makes, Triumph, Rudge, A.B.C., etc., price **10/-** per valve.

THE TONY COMBINED ALUMINIUM FOOTBOARD AND FOOTRESTS. Beautifully finished — giving a

natural riding position. A real solid cast job. Something that lasts for ever. Price **30/-** per pair complete.

AIR COOLED VALVE CAPS. My latest are covered by patents. They never blow out nor seize in the threads. Absolutely gas-tight. Prevent knocking and keep the engine cool. Try them on your 2¾ h.p. or 4 h.p. Douglas, and if you are not absolutely satisfied have your money back. Price **4/-** each.

ZOOM! ZOOM!! The popular Exhaust System. Beautifully made, finished in burnished nickel or copper. A pleasant Zooming note without back pressure. Adds pounds to the appearance of any Douglas. Price **30/-** in copper finish, **33/6** nickel.

LEATHER TOOL ROLL. A real heavy affair that will stand rough usage. Fitted with leather pocket, two side flaps, leather centre tool holder and leather strap. **5/-** each.

TOOLBAGS. Solid leather and metal armoured, two straps. Very best quality. 4 h.p. size, **8/-**; 2¾ h.p. size, **5/6** each. A bargain line.

"H" SECTION CONNECTING RODS for 2¾ h.p. Douglas. Stronger. No whip, and reduces vibration. Immediate delivery, **26/-** each.

ANY SPARE PART BY RETURN OF POST.

4 h.p. and 2¾ h.p. **INSTRUCTION BOOKS, 1/6** each.

IGNITION, LIGHTING, ETC.

MAGDYNAMO Engineering Co., Ltd., for magnetos, spares, and repairs.

MOTOR Cyclists fit reliable high quality magnetos now and avoid certain failure of inferior magnetos.

BOSCH Enclosed Waterproof Type D.A.L. Magnetos, Government surplus, ready to fit on Indian, Harley, J.A.P., or any big single or twin, gives powerful spark at all engine speeds, makes your engine a real live engine, give you easy starting, smooth and rapid acceleration, high speed, and low fuel and oil consumption with increased power; price only £5 each, postage 1/6 extra; a 12 months' written guarantee sent out with each magneto. We give you satisfaction or refund cash.

PLEASE Note, the above type magnetos were originally manufactured for 200h.p. aircraft engines; therefore we have every confidence in claiming them to be the magneto you require for your big machine. Fit one to-day, and see life with a live machine.

HARLEY-DAVIDSON Owner writes: "Magneto to hand; many thanks for prompt despatch, satisfactory in every way; will recommend to my friends."

ZENITH Owner writes: "Since fitting magneto have completed a run of 250 miles; highly satisfied; will certainly recommend these magnetos."

INDIAN Machine Owners.—Your high-class machine deserves a high-class magneto. We want 1,000 Dixie 42° magnetos; send your magneto and £4 now, and we will immediately despatch you a Bosch D.A.L.

WHY is it that the leading Motor Cyclists—the men who know—are almost all sending to us for their Magnetos?

THERE must be a reason; there is; it is because the Magnetos of quality and guaranteed service, supplied by Magdynamo, beat all other Magnetos.

MAGDYNAMO will take your old Magneto in part payment.

REMEMBER your magneto is sent on 14 days' approval against cash per return on receipt of your order; there is no obligation to keep it until you have used it for 14 days on your machine and are satisfied: let us send you one now.

ARE You a Discerning Douglas Owner? Do you want a reliable magneto with 12 months' guaranteed service that will give you starting without worry, a smoother running, and more powerful engine and better results from your Douglas? Then send for a latest enclosed waterproof type Bosch XA2 magneto now, price only £5, carriage 1/6.

C.A.V. Magnetos (not converted starters), ready to fit on Triumphs, B.S.A.'s, Nortons, and P. and M.'s, with 12 months' guaranteed service, price £3/10, carriage 1/6.

THOMSON-BENNETT Magnetos, latest enclosed waterproof type (not converted starters), ready to fit on 55° Clynos and 180° Douglas machines, with 12 months' guaranteed service, price £3/10, carriage 1/6.

MOTOR Cycle and Car Owners, are you testing all your sparking plugs properly? Are you wasting pounds yearly by throwing away good plugs? Fit a Bosch aeroplane hand starter magneto on your garage bench to-day and always have your sparking plug tester at hand, price £2, carriage 1/6.

TRADE discounts and export quotations.—Write, call, or 'phone for terms.

A YEAR'S guarantee on repairs. Before you scrap that magneto, whatever its condition, let us see it, we will rebuild your magneto to look and work like new, no matter what make, within 3 days or 24 hours if urgent, and return it with a written 12 months' guarantee. While your magneto is being repaired we can lend you another free of charge. We could not make these offers if we were not certain of the quality of our work.

YOUR old magneto will be equivalent to new at a low cost. Send us your defective magneto now.

ARMATURE rewinding, no matter what make, type, or size, 11/6. Wound cores from stock.

Exterior Aids to Speed.

AT the present time at Brooklands there is a great deal of discussion regarding secret fuels and other exterior aids to speed; furthermore, certain successful riders are known to adopt such means to gain a little advantage over their contemporaries. No doubt the practice serves a purpose apart from assistance in winning a race or reducing record figures; it must indirectly further advance developments in engine design and construction. Any extra power obtained must proportionally place increased stresses upon the engine.

The idea is not new, although the nature of the ingredients used to-day may be. Over a decade ago such exterior aids as oxygen, picric acid, ether, and acetylene gas were used by the hill-climbing exponents of that era. In a little while, however, further increased power was obtained by mechanical means, and progress took a long step forward.

During the practising for the last Tourist Trophy races several so-called "dopes" were tried, but it is significant that all the winners used known fuels only.

If there is any advantage accruing from the addition of chemical agencies to the fuel, it is only possible to utilise it for comparatively short distances.

The present revival of the practice shows how history works in cycles, and that at certain irregular intervals there comes a time when no one designer has a monopoly of efficiency. The latter end of 1922 marks perhaps one of those epochs.

History will repeat itself. Before the Brooklands racing season re-opens, increased efficiency will be obtained by design, and until the exponents of speed are once again on level terms, chemical agencies will be laid aside. Either way, the matter is not likely to cause heart-burning among average motor cyclists, because chemical additions to petrol are only advantageous to those to whom even a fifth of a second in a kilometre is important.

Sportsmen All.

IT has been asked if motor cyclists of the North are keener and more capable than their Southern brothers. This seems likely to initiate a controversy which can only lead to invidious comparisons.

At first glance there might be some little justification for the supposition. The designation "sporting rider" has become practically synonymous with one who spends the greater part of his time in the saddle in searching out and attacking freak gradients and forbidding obstacles of every description; when not so engaged he is competing in speed hill-climbs and the like. Now the North-country riders excel in this kind of thing, for the simple reason that the districts in which they live encourage and in many instances even necessitate going over tracks the like of which many riders in the Home Counties never see; should the latter class of riders, however, become transplanted to a more violently sculptured section of the country, it is not to be thought otherwise than that the same British spirit pervading all of us would rapidly make the scaling of precipices an habitual enjoyment to them as it is to the dwellers in the rugged places.

Nor has the North a monopoly of the type of country that breeds sporting riders. In Wales, in the Western Midlands, and in the South-West, too, are hills and tracks to taunt and test the best, the most enthusiastic, and the most skilful riders.

An index to the advertisements in this issue will be found on the page facing the back cover.

Another "Service" Scandal.

THE welfare of the industry is so bound up with prompt and efficient "service" that it is a real kindness alike to maker and user if any slips are exposed. On June 17th a Midland reader discovered that his 1921 cylinder head was cracked, the engine being a proprietary type fitted to many makes of machine. A new one was ordered through the local agent that night. The subsequent history of the job is as follows:

June 28th.—New head received. Piston bumped right up against it.
June 29th.—New head returned to makers.
July 3rd.—Urgent letter from rider, requesting prompt service.
July 18th.—Makers return the same head to local agent, stating that they manufacture no other type. If it did not fit, a packing piece must have been fitted over big-end. This should be removed, when head would fit. (N.B.—Engine had never been dismantled since delivery.) Rider dismantles engine, finds packing piece ¼in. thick, and manages to fit the head. Great loss of power and speed, as the original head was a special high compression pattern.
August 2nd.—Makers write direct to rider, admitting that they had sent out a few high compression heads. None in stock at the moment, but they will make one, and forward.
September 30th.—No further communication from makers, except a bill for £2 18s.

The Service Manager on the Job.

IF I were appointed service manager of this firm I should get very busy indeed. On this one job, urgent letter A remains unanswered for 15 days. Urgent letter B remains unanswered for 14 days. Promise C is left unfulfilled for upwards of 59 days. These are matters of pure office routine, and suggest wholesale dismissals and reorganisation. Then there is the technical side. My firm is manufacturing a special sports engine. Agents and users handle this engine without being aware that it is not standard pattern. Steps should be taken to let users know that standard spares do not fit. All agents should be impressed with the differences between the two types. Above all, my own storekeeping department should be informed that such engines are in customers' hands, should be put on the *qui vive* for identifying replacement orders, and should be provided with an ample reserve of the necessary parts.

To run a business on the lines adopted by this concern is one loud shriek for the services of the Official Receiver.

The Best Mechanical Pump.

SEVERAL correspondents have written to endorse my eulogies on this no-trouble oiler, and agree with my verdict that you just keep oil in your tank, and the pump does the rest. In practice I do not find it necessary to adjust the level on the pump, even with an o.h.v. Triumph, which can be driven as a sucking dove or a road devourer, according to one's caprice. If I used a sidecar, I might have found this lever useful. At any rate, one reader remarks that his sole criticism is the difficulty of operating the tiny locking catch of the pump plunger with a gloved hand, after injecting an extra dose by hand. Personally, I have left my plunger locked all season, and cannot conceive of any circumstances in which a solo-ist need give a hand charge. However, I pass on my correspondent's solution of the difficulty. He fits a rubber ring round the catch, so that it locks itself when the plunger reaches bottom. He suggests that the makers should fit a spring catch.

More About Challenger Tubes.

THE third complaint of the year about Challenger tubes is just to hand, a rider stating that after several thousand miles the inner layer of red rubber split and caved inwards along the tread. The makers reply plausibly enough that this fault is rare and is always due to gross under-inflation. They admit, however, that manufacturing problems occur in the relative curing of the red rubber of the tube and of the black mastic "sealing" insertion; and that in a few tubes the inside rubber may have been the least thought undercured, thus enhancing any evil consequences of riding a tyre too soft. The black mastic is apt to "draw cure" from the red rubber; and to prevent this terrible catastrophe, they now enclose the black mastic in an envelope of quick curing grey rubber, which divorces it from the red rubber of the tube. I have devoted some attention to these tubes, first because they are among the very few specifics which offer some protection against small punctures, and, secondly, because my own sets have never given me any trouble or failed in their work.

273,000 *v.* 50,000.

IT is computed that the existing motor cycle plants of Great Britain could turn out 273,000 machines per annum, working at full pressure. The present annual output is rather under 50,000 machines. More

"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

Occasional Comments.—

than 150 firms (including many small assemblers of standardised units) are occupied in supplying this rather beggarly total. Some significant facts emerge from a consideration of these figures, which I owe to *The Motor Cycle Trader*. Lumping the factories together, each of them sells 330 machines a year. The Ministry of Transport's taxation figures for Great Britain (dealt with on another page) denote that only 377,000 motor cycles were in commission altogether on August 31st.

From the User's Standpoint.

AS patrons of the industry, we users must confess that its condition is not too unhealthy. We desire from any manufacturer whose wares we buy that he shall sell us a machine at rock-bottom price; back it up with generous service; develop it to the limits of perfection embodied in the design; be financially stable, so that spares shall be available for twenty years to come; and keep his experimental and research departments so hard at work that he can give us something still better presently. It is quite obvious that very few firms can afford such a programme under the conditions outlined above. No wonder that fascinating novelties bob up, and presently disappear, as their sponsors exhaust their capital.

Towards Better Things.

REAL health can never adorn the motor cycle industry until it is running smoothly and working "up to capacity," which implies an annual output of round about 270,000 machines per year (if present conditions are maintained). Alternatively, a number of firms might go out of business, and the present sales of 50,000 continue, emanating from a few factories running at full blast. In this case, the industry might tend to stagnate—we should get less variety in design. One solution probably lies betwixt and between. Unless Britain becomes much wealthier, it can hardly absorb 270,000 machines per annum. Once again I repeat, therefore, that a solution lies in an energetic sales campaign in overseas Dominions. The obstacles to exports which have existed since the war are rapidly becoming things of the past.

NO LONGER DIFFICULT. Two or three years ago productive of many anxious moments, Flagstaff Hill during 1922 has been included in quite a number of Midland Trials without causing many failures. E. Arthur (976 Brough Superior sidecar) climbing it well in the Sutton Coldfield and North Birmingham event this month.

Bad Weather Ahead.

ABOUT this time of year I discard the light summer waterproofs, climb up to the attic with a pitchfork, and stir up a dump of all-weather overalls of all sorts, shapes, and sizes, until I have dug out something likely to keep me warm and dry in the bad weather which can be expected shortly. And here's a hint to the trade. I usually have half a dozen sample suits on test, but my choice invariably falls on the suit which is easiest to put on and take off, provided, of course, that it is moderately warm and rainproof (nothing but oilskin is absolutely drencherproof for many weeks together). The novice might fancy that all "split" leggings were easy to put on. They aren't. I have three or four samples which are most laborious wear.

For Long Rides.

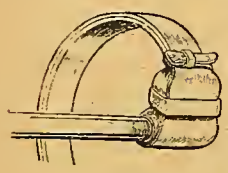
IF one is contemplating a non-stop of 100 miles or so in dubious weather, warmth and what the Cornish villager terms "dryth" are far more important than convenience in dress- and undress- ing. For sheer warmth there is nothing to beat the ex-R.A.F. Sidcot suits, but some of them are made with rather an inferior twill, which doesn't stop persistent rain. For sheer "dryth"—some Cornishman will correct my spelling if faulty—a rubber poncho looks after one's top storey most efficiently, supposing the tearable nature of oilskins deters one.

Head Wear.

THE ideal storm hat for motor cycling has not yet been invented. You need something to shield your face when a twenty-mile wind is added to your own 40 m.p.h., and the resultant gale is tipped with hail or rain; and brimless helmets convert your pink cheeks into a perfect target for such icy arrows. Why is there no helmet with a leather-covered aluminium peak, as long and stiff as those on a jockey's cap. Similarly, unless you are wearing a poncho with a draw-string or an umbrella neck, you need something to stop liquid weather from trickling down your collar. The common dodge of wearing a scarf is most uncomfortable.

AMONG THE ACCESSORIES

Sidecar Shackle Covers.



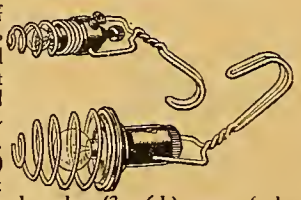
Neglecting to lubricate sidecar shackles leads to annoying squeaks. The Dickens leather cover makes greasing a yearly instead of a weekly task. 5s. per pair. (Dickens & Co., Ltd., Cross Cheaping, Coventry.)

Electric Bulb Adaptors.

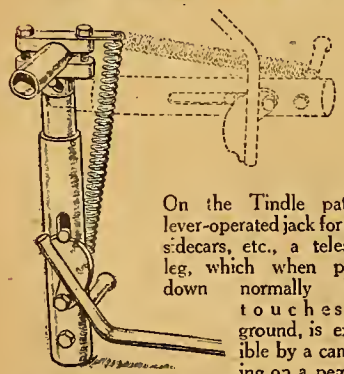
Five fibre disc adaptors for the conversion of double-contact bulbs to single contact, or *vice versa*, and tweezers to facilitate handling are packeted by Andrew Page & Son, 68, Albion St., Leeds, at 1s. 6d. per set.

Useful Inspection Lamp.

Two sizes of inspection lamp are marketed by A. H. Hunt Ltd., Tunstall Rd., East Croydon, Surrey. The larger (6s.) has a bayonet clip bulb and the other (3s. 6d.) one of the screw-in type.

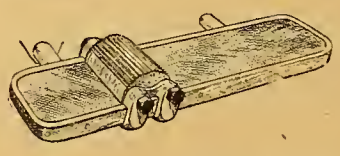


Self-locking Sidecar Jack.



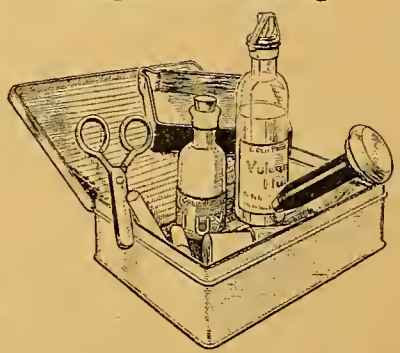
On the Tindle patented lever-operated jack for heavy sidecars, etc., a telescopic leg, which when pushed down normally barely touches the ground, is extensible by a cam acting on a peg protruding from the inner member. A slot in the cam locks it in the fully open position, the upper hinge being self-locking. (A. T. Tindle, Hood Street, St. John's Chapel, County Durham.)

Adjustable Footboard Pads.



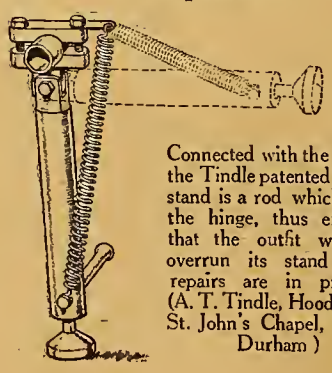
Although originally designed for Douglases, the E.L.I. footboard pads fit a number of other machines, affording an excellent grip for the rider's feet. 7s. 6d. (Eli. Clarke, Cheltenham Road, Bristol.)

Simpler Vulcanising.



It is claimed that the Desmo cold process of vulcanising effects repairs equal in every way to ordinary vulcanising. Anyone can use it; a torn tube takes ten minutes to put in order; and, as far as we can judge, the only drawback is the extremely unpleasant odour of the chemicals! The motor cycle size of outfit, illustrated, is 5s. 6d. (Desmo Ltd., 264-5, Broad St., Birmingham.)

Automatically Locked Sidecar Prop-stand.



Connected with the base of the Tindle patented sidecar stand is a rod which locks the hinge, thus ensuring that the outfit will not overrun its stand while repairs are in progress. (A. T. Tindle, Hood Street, St. John's Chapel, County Durham.)

Convenient Eye Protection.

Fitted with a spring hinge and clipped to the peak of the cap, the "Gleam" non-inflammable celluloid eye shield is a useful substitute for goggles. (Brown Bros., Ltd., Great Eastern Street, London, E.C.)

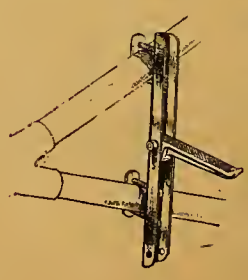
Plug for Hot Engines.

90% nickel electrode and porcelain insulation are said to render this new Hobson motor cycle plug immune from pre-ignition. 5s. (Hobson Manufacturing Co., Ltd., 29, Vauxhall Bridge Road, London, S.W.1.)

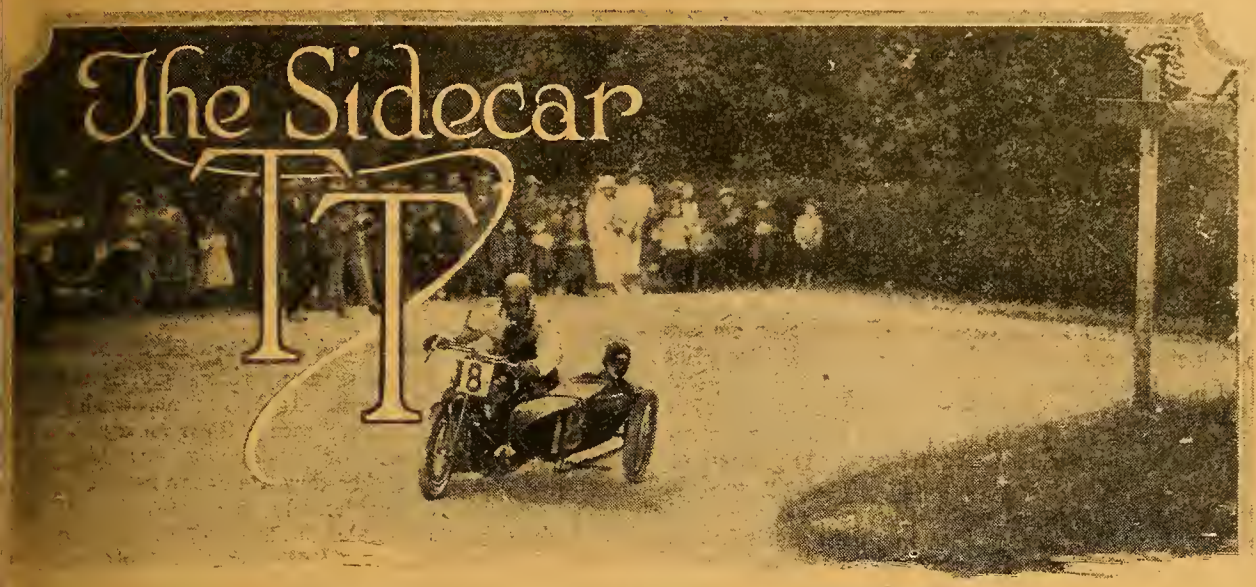
Hollow-cone Valve Cap.

It is claimed that since the Beard & Fitch spirally-finned aluminium valve cap is hollow, it dissipates more heat than is usually possible. It is stocked to fit most engines. (Beard & Fitch, 34, Aylesbury Street, Clerkenwell, London, E.C.1.)

Foot rests for Pillionists.



Pillion riding is made safer, possibly, and more comfortable, certainly, when foot rests such as the Pidco type are fitted. (Norrish & Pidcock, Lonsdale Chambers, 27, Chancery Lane, London, W.C.2.)



Why Exclude Runabouts? A Genuine Passenger Machine Race Suggested.

By B. H. DAVIES.

THE A.C.U. decision to organise a sidecar T.T. in 1923 will act as a charge of high explosive in motor cycle circles.

No proposition could have stirred up so many sleeping dogs and opened such highly-contentious questions. In tackling some of the obvious corollaries I must be understood to vent purely personal opinions. The immediate comments which every knowledgeable rider will make are somewhat as follows:

1. "No amateur race, then?"
2. "There'll be some casualties."
3. "Why are Morgans excluded?"
4. "What's the matter with the four-wheeled cycle car?"

As the Manxmen will not close the roads for a fourth race, a sidecar race implies despair of the possibilities of running an amateur event. I shall shed no tears on that account. It is not difficult to devise a race in which amateur riders, backed to varying degrees by various factories, shall ride against each other. It is absolutely impossible to run an event in which amateurs shall compete on owner-tuned standard machines and let the best man win.

No Reasonable Deterrent.

On the casualty question it is probably easy to be over too timid. The solo races have produced one or two serious accidents in the past, but injury has been conspicuously absent since the advent of the crash helmet. There may be a higher percentage of smashes in sidecar practising and racing. The sidecar machine steers with less docility than a bicycle. Overtaking will be endowed with fresh dangers—dangers more substantial than those of a car race. Structural fractures will occasionally occur. Two men are involved in each entry, of whom the driver may be thrown clear—motor bicycle fashion—in a smash, but the passenger will generally take whatever impact is coming. (Incidentally, I would not be a passenger in such a race for any small fee.) Still, the casualty list might be very considerably greater than recent solo T.T. figures without necessarily ranking as a reasonable deterrent.

My own objections to the proposal in its present form assume shape at this point. The A.C.U., to all intents and purposes, announces dogmatically that the sidecar is the one and only light passenger vehicle of the future, and that it is worth our while to spend thousands of pounds (and possibly a life or two) in developing the sidecar by racing. I deny both propositions flatly. The sidecar is not the only possible light passenger vehicle. Even if it were, I am not convinced that racing is necessarily essential to its development, though I am ready to hear this thesis argued.

500 c.c. Three-wheeled Cycle Cars?

The Morgan runabout certainly sells as freely as most single makes of sidecar outfit. As a direct and promising rival to the sidecar, the three-wheeler has an obvious and incontestable claim to a share in any advertisement and any technical development which may be going. At present there is no famous or even well-known three-wheeler with a small engine of the 500 c.c. or 750 c.c. type. Financial conditions are to blame for this. Technically, there is no reason at all why a 500 c.c. Morgan should not compete as successfully with 500 c.c. sidecars as the 1,000 c.c. Morgan competes with the big sidecars. On the exclusion of the three-wheeler only three opinions are possible. The first is that it has been accidentally overlooked. The second—already widely mooted—is that the Morgan formerly made a habit of winning in any open three-wheeled event, and that sidecar interests are afraid lest history should repeat itself. The third is that no small-engined three-wheelers at present exist, and that the A.C.U. does not want any raw entries. Surely the event ought to be thrown open to

The Sidecar T.T.—

any type of three-wheeler? If the Morgan type is not entered, that will be its makers' funeral, and the A.C.U. will be guiltless.

Fourthly—and here we enter a sea which is full of reefs—a great many authorities believe that the future of light two-passenger work rests with the four-wheeled cycle car, such as the G.N., Tamplin, and Carden. If this race is to be based on a low capacity limit—say 500 c.c.—the R.A.C. would probably consent to the inclusion of four-wheelers. Foreign bodies, if awkward, might be defied or ignored; such a disagreement would not affect any of the major matters for which international amity is so valuable. The point is this. The proposed race may—and under present proposals will—dwindle to rather a parochial affair. A certain number of British sidecars will struggle for individual advertisement and renown. Organised on a broader basis, the race might ultimately lead to new types of passenger machines.

Very probably the 1923 race would be a mere picnic among the sidecars. If somebody produces a good 500 c.c. three- or four-wheeler, and either wins the suggested "Passenger T.T.," or covers himself with glory in it, his market will be assured. France will certainly play a hand in such an event, if we organise it. As engine efficiency increases, and cheap motoring becomes more and more of a slogan, a 500 c.c. Morgan and a 500 c.c. G.N. are possible *débutantes*. In fact, if the times had permitted audacious ventures we should already have seen 500 c.c. cycle cars.

Supposing the powers that be turn down the broad view and irrationally limit their new race to the favoured sidecar, they will miss a screaming opportunity if they limit it to "500 or 600 c.c.," as suggested in their *ballon d'essai*. We have latterly recognised that the big British twin is an essential part of our output. The home market absorbs a certain quantity; the overseas market fairly unanimously turns down our smaller engines and favours—rightly or wrongly—America's big twins.

Arguments for the Big Sidecars.

The Manx course, so many riders say, is unfit for a 1,000 c.c. solo race. It is not necessarily unfit for a 1,000 c.c. sidecar race. Such an event would give us the chance of developing our big twin and of proving whether they are or are not better than the Americans. Incidentally, it is still the big twin which is the backbone of the demand for sidecar work; the 500 c.c. engine is freely used for that purpose but mainly as a *pis aller* by owners who cannot afford more horse-power.

To sum up, I hope that the new race will blossom into a "Passenger T.T." and include light four-wheelers. If it should be restricted to sidecars, there are strong arguments in favour of raising the capacity limit to include "big" twins.

FURTHER OPINIONS ON THE SIDECAR T.T.

Prominent Sidecarists in Favour of the Race. Three-wheelers not Favoured.

IN our last issue the opinions of well-known personalities on the three main points now being discussed in connection with the proposed Sidecar T.T. were given. These three points are:

(1) Would such a race help the further development of the sidecar?

(2) Is the sidecar a suitable vehicle to race on comparatively narrow and tortuous roads?

(3) Should three-wheel runabouts be admitted to the race?

What the Race will Do.

Never has opinion been so unanimous as on the first two questions; not a single dissentient wrote us last week. Below we are able to give extracts from a further batch of letters, and again everyone is of a single mind on the first two and most important points raised.

J. A. Masters (Harley-Davidson).

I certainly think that such a race would assist in the development of the sidecar, as in a contest of this nature the sidecar would be very thoroughly tested out, and sidecar manufacturers no doubt would obtain some very valuable data, particularly with regard to wheel bearings and frame connections.

I do not think that it need be feared that development would be upon wrong lines. A sidecar which would stand up to a strenuous event like the T.T. must be designed more or less upon lines which would make it suitable for hard touring work. To encourage this I should like to see a minimum width of track stipulated in accordance with touring requirements. Furthermore, the race should considerably assist in the development of the sidecar machine, as the latter would be subjected to strains and stresses which the hardest solo riding would not make apparent.

The question of the sidecar outfit being a suitable vehicle for a race on comparatively narrow and tortuous roads is largely a matter of opinion, but I do not think that it would be any more dangerous than a car race on similar roads.

After all it is largely a question of the driver's ability and it is for him to find the limit of safety at which the roads can be negotiated with a sidecar outfit, the same way that it has already more or less been found with solo machines.

I am not in favour of three-wheeled cycle cars competing in the same class as sidecar machines, in any competition. A sidecar machine and a three-wheeled cycle car are two distinct types of vehicle, and whilst it would no doubt be interesting to see them in competition together they should compete amongst themselves in separate classes.

George Grinton.

I think that a sidecar T.T. would undoubtedly help to develop a better sidecar machine.

I consider the Isle of Man roads would make a splendid test for a sidecar machine, and although they are narrow in some parts two machines could easily pass each other in safety on the greater part of the course.

The race should be kept purely a sidecar one, and I am strongly in favour of the sidecar limit being raised to 1,000 c.c. I have tried a 1,000 c.c. machine on the course and I hold it is perfect nonsense to say that this machine is too fast or dangerous for a T.T. race in the Isle of Man.

J. E. Greenwood (Sunbeam).

If the sidecars used are of a fairly normal design, and not freaks, a good purpose will be served. They should be examined by experts before the race to see if they are safe, not only to the rider but to other competitors.

The Isle of Man course is quite suitable if the machines are in the hands of thoroughly capable and experienced men—not otherwise.

I do not agree that three-wheel runabouts should be included.

W. Giles (A.J.S.).

This company has always advocated racing in all its rms as being one of the best and quickest ways of "im- oving the breed." We, therefore, look favourably on the w sidecar race. When one considers the enormous amount knowledge which is gained each year by manufacturers o compete in the solo races, there is little doubt that the ecar outfit will materially benefit by such a race. It is ite possible that the knowledge gained will apply more the machine than the sidecar, but, nevertheless, it will of a useful nature.

It is to be hoped that nothing freakish, and of a nature t applicable to touring conditions, will be introduced, d it might be advisable to make some regulation with ard to weight and width, which should not be cut down absurdities.

There is little doubt but that the drivers would adapt mselves to the course, and that the speed would auto- tically adjust itself in exactly the same way as it does the solo race. One thing, however, is certain, and that that this race would call for great driving skill, and a sonable amount of restraint.

We can see no reason whatever why three-wheeled cycle s should not be allowed to compete.

W. Barnes (Zenith).

A sidecar race would considerably help the development an efficient sidecar. I consider a sidecar is just as safe l suitable a vehicle as a solo machine to race on the .M. roads. It is just as easy to seek trouble on a solo chine as on a sidecar.

By all means, if it is possible, make it a race for three- eeled passenger machines. We might see something new in an appearance.

C. de la Hay (Sunbeam).

A race of this description could not fail to further the elopment of the sidecar, and the result should be to give public a greatly improved machine in the direction of ght, strength, and steering capabilities.

The race should be as safe as the solo race providing very ngent rules are laid down with regard to design and ipment; furthermore, it would be essential to the safety all concerned that experienced drivers only be allowed to pete.

All machines should be passed by competent engineers, and e of our foremost designers and riders should be asked give the benefit of their experience in drawing up the ulations with regard to design, etc., and in examining competing machines.

do not favour admitting three-wheeled cycle cars to the nt; in the first place these may offer difficulties with ard to passing on the more difficult parts of the course, also, if the race is to be a sidecar race, let sidecars only pete.

A. R. Grindlay (Sidecar Manufacturer).

Undoubtedly the suggested race will materially help in the development and improvement of the sidecar, but we consider that the race should be looked upon as an experiment only and not be run for the full length of the T.T. course.

We do not think that, in an experimental race of this nature, three-wheeled cycle cars should be admitted; but there is no reason why it should not be done another year, providing the sidecar event proves to be satisfactory.

John W. Meredith (T.B. Three-wheeler).

Three-wheeled cycle cars should certainly be admitted, as in all competitions in the past three-wheelers have to compete chiefly against motor cycles and sidecars.

Eric Williams (T.T. Winner).

To a certain extent this race would tend to help development of the comparatively lightweight sidecar outfit, as it will give sidecar manufacturers an opportunity of advancing and testing chassis designs.

I do not consider that the I.O.M. course is too narrow or too rough, nor that there is any more danger than in a solo event, but think it should be considered that ballast might be used instead of a passenger.

Three-wheelers might be admitted if they come within the limits of capacity allowed.

W. A. Fell-Smith.

For several years I have been a strong advocate of a sidecar T.T., and it has been a matter of some surprise to me that any suggestions made in your correspondence columns to the effect that a sidecar T.T. should be held have hitherto had cold water poured on them by the A.C.U.

I see no reason whatsoever why sidecars should not be raced on the Isle of Man course just as safely as cars—in fact, I should have thought the sidecar to be by far the safer vehicle, properly driven, on narrow roads.

Three-wheelers, to my mind, can be raced on equal terms with 1,000 c.c. sidecars, but if any restrictions are to be imposed on engine capacity for sidecars I am all in favour of excluding three-wheelers from the race.

Reg. Brown.

I have been looking forward to a sidecar T.T. for years.

I am certain it will help the development of sidecars; also improve the designs. It will also teach the manufacturer where strength is required in both frame and chassis, and will certainly be a more gruelling test for engine and gear box than the solo T.T.

I would just as soon race with a sidecar as solo on the Isle of Man course, and do not think there is any more danger, provided one rides with one's head.

I certainly do not think that cycle cars should be admitted to the race.

ALL ABOUT TWO-STROKES.

HAVING only three moving parts—crankshaft, piston, and connecting rod—the two-stroke is bound to be the most popular type of motor cle with the novice. The number of two-stroke lightights now in use in this country must be over ,000.

But because it only has three moving parts is no ason to suppose that nothing can be done to improve t running; or, if mystifying symptoms appear, that t s within the scope of the tyro to remedy them. this reason "Two-stroke Motor Cycles,"* now ts second edition, has always been a popular handok. Prepared by the staff of *The Motor Cycle*, the ok contains nearly 200 pages and deals with all there is to know about this type of machine, particularly from the owner's viewpoint.

Three very valuable chapters are entitled "Getting the Best Results on the Road," "Tuning Up," and "Tracing Troubles." Another gives special instructions on the detection of faults in the electric lighting systems more often employed on two-stroke machines, and a final chapter, auxiliary to the simple descriptions of how everything works, is devoted to the more technical aspects of two-stroke engine design, regarding which little is known by the general public.

Interesting units are described in detail, and exceptionally clear drawings and photographs are used throughout to supplement the letterpress.

No owner of a two-stroke motor cycle can afford to be without this handbook.

*Iliffe & Sons Ltd., Dorset House, Tudor Street, London, .4; 2s. 6d., by post 2s. 9d.

QUEER MOTOR SPIRIT.

"Dope" on the Track. Racing Men Rubbing up their Knowledge of Chemistry.

REALLY the B.M.C.R.C. will have to consider the question of providing gas masks for spectators at its race meetings if the present craze for "dope" continues. Asphyxiation is risked by the unwary looker-on who gets in the way of many an exhaust. The Paddock begins to smell like a chemist's shop, and talk in the members' tea-room turns on the subject of formulæ.

A Deadly Secret

For "dope" has become the favourite topic of Brooklands *habitués*. They gather in small knots in dark corners and talk of how so-and-so suddenly pushed his speed up five miles an hour, and so upset "Ebby's" handicap calculations. But never was a secret more jealously guarded: "dope" is not spoken of as such, nor are the constituents thereof ever mentioned. There is an uncomfortable silence when the outsider talks of what his nose has told him, until ("only a small one this time—don't drown it"), becoming on more familiar terms, it is confided that somebody first introduced it, and everybody else has had to follow in self-defence.

The funny part is that the liquid (euphoniously dubbed "mixture") always emanates from a petrol can in the same manner as that old-fashioned stuff now termed "straight spirit." True, a certain big tw exponent gave the game away one day by walki across the Paddock with a two-gallon Winchester one hand and a measure glass in the other, but th were very few people about that afternoon. Neverth less, it was generally felt that the action was a tri indiscreet.

Available Anywhere.

What's that?—no, don't ask me: *I* can't tell y what the stuff really is. For all I know it might chloroform or ether and/or alcohol, but I don't thi you need attach any credence to the whisper of "gu powder and picric acid" that I happened to overhe They do say that South Africa is not unconnected w some of the stuff, but I feel I ought to add that c local avers that he buys all the components of mixture in the village.

Of course, there's no rule against using any sort fuel you like. Whether or not there should be is moot point. I suppose the B.M.C.R.C. can put ban on "dope" if it feels it ought to: perhaps will commission the stewards to put their noses ins all tanks before the start of a race. At any rate, so protection should be extended to the spectators.

"GAS."

A TRAFFIC CENSUS.

THE 17th annual *Motor Transport* Edgware Road Traffic Census of nine hours (9 a.m. to 6 p.m.) shows that the number of private motor cars which passed was 1,422, constituting a new record; this is 217 more than the total counted last year. Taxi-cabs, on the other hand, showed a decrease, as of these vehicles 1,229 passed, which is 81 less than the 1921 figure.

Motor 'buses were also fewer, the total number being 2,058, as compared with 2,164 counted at last census.

A new record was established by motor trade vans, which totalled 1,768, beating last year's record of 1,515 by 253.

New records were made by solo motor cycles a motor cycle and sidecar outfits. Together th totalled 348, of which 148 were solo machines, carriers, and 136 had sidecars attached.

Pedal bicycles numbered 2,308, as against 1,691 last year; a record of 2,355 was established in 19 Pedal carriers included in the above count numbe 254, which is a long way below the best figure, althou better than last year's 182.

During the nine hours, the total number of vehic passing both ways amounted to 10,442. This is anot record, showing an increase of 516 over the previ record of 9,926 in 1912.

IRELAND'S PREMIER ROAD RACE.

Further Impressions of the Ulster Grand Prix including those of two Successful English Riders.

As described in *The Motor Cycle* last week, the first Ulster Grand Prix Race was held on Saturday, October 14th, amid scenes of enthusiasm unparalleled in Northern Ireland. H. W. Hassall (o.h.v. Norton) won by the narrow margin of 44⅘ seconds.

This was not the first road race engineered by the sportsmen of the North, but was the culmination of at least two years' hard work and practice in this particular branch of motor cycle activity. To the promoters (the Ulster Motor Cycle Club), to the Royal Ulster Constabulary, and to the residents in proximity to the course, the thanks of thousands of people are due for the spirit of co-operation and goodwill which made the day so successful.

The Northern Parliament has fully realised the importance of fostering motoring in all its branches, and, in accordance with an Act of Parliament passed recently, the Ministry of Home Affairs authorised the closing of the roads from 12.30 p.m. till 5 p.m. The Antrim County Council loyally gave all the support possible.

Seven Twenty-Mile Circuits.

The triangular course touched Crumlin, Muckamore, Aldergrove, and Antrim. The laps were of 20½ miles, and had to be covered seven times, equalling 143½ miles; all the important corners were right-hand ones. The race was on the handicap principle, and was, therefore, very easy to follow, as no man had a starting debit in hand, and the first machine over the line was the winner.

The writer was stationed at Muckamore corner, and saw some very neat exhibitions of riding (ill and some the reverse. Among the lightweight riders, K. McCleery (348 Diamond), H. Palmer (348 Diamond), S. M. Adams (348 Raleigh), and S. A. Dale (349 o.h.v. New Scale) showed considerable skill in negotiating this corner. Easily the best displays on the heavier machines were made by T. Mallon (492 Sunbeam), H. Hassall (490 o.h.v. Norton), J. Hill (494 Douglas), and N. P. Metcalfe (976 Brough Superior).

In the earlier stages of the race, before men began to drop out, some very consistent riding was shown, but, as time went on, gaps began to appear in the ranks, especially among the 250 c.c. and 350 c.c. machines. K. McCleery (348 Diamond) made a record first lap, and in sixteen miles actually jumped five or six places. His brother, H. McCleery (481 Scott) rode steadily throughout, and well deserved the place in which he finished. J. W. Shaw (490 o.h.v. Norton) as usual put up some very fast times, doing the first two laps in 40 minutes, and J. F. Dinsmore, also on a Norton, lapped most consistently. F. Andrews (348 Trump-Jap) made a magnificent ride, and was only beaten by 44⅘ seconds when actually within sight of the judges.

S. A. Dale (349 o.h.v. New Scale) and S. M. Adams (348 Raleigh) rode well and picked up places in the earlier laps. T. Mallon (492 Sunbeam) came round with almost clockwork regularity, which was all the more worthy of praise as he had only had his machine delivered on the previous day and had never been on the course prior to the race

Fastest Lap.

To H. Langman (532 Scott) fell the credit of fastest lap, which he covered at the average speed of 65.77 m.p.h.

H. Hassall deserved his victory, for he put up a splendid performance throughout, giving the limit men no less than 59 minutes allowance. His average for the course was 60.7 m.p.h.

Detailed results are as follow :—

1. H. Hassall (490 o.h.v. Norton). Handicap, 1m. Net time, 142m. 8⅘s.
2. F. Andrews (348 Trump Jap). Handicap, 31½m. Net time, 173m. 53⅕s.
3. J. F. Dinsmore (490 Norton). Handicap, 6m. Net time, 149m. 29⅘s.
4. J. Whitehead (481 Scott Squirrel). Handicap, 11m. Net time, 156m. 42⅖s.
5. F. Hamilton (481 Scott). Handicap, 10½m.
6. W. S. Handley (248 o.h.v. O.K. Junior). Handicap, 15m.
7. J. Hill (494 Douglas). Handicap, 6m.
8. S. Wallace (248 o.h.v. Rex Acme). Handicap, 33½m.
9. W. Murray (348 Francis-Barnett). Handicap, 45m.
10. H. McCleery (481 Scott). Handicap, 5½m.
11. C. A. Sleator (348 Mohawk). Handicap, 35½m.
12. T. Mallon (492 Sunbeam). Handicap, 4½m.
13. N. P. Metcalfe (976 Brough Superior). Scratch.

250 c.c. Class.

1. W. S. Handley (248 o.h.v. O.K. Junior). Handicap, 15m.
2. S. Wallace (248 o.h.v. Rex Acme). Handicap, 33½m.

Unlimited Class.

1. N. P. Metcalfe (976 Brough Superior). Scratch.

H. W. Hassall, the victorious rider of an o.h.v. Norton, being escorted away at the finish of the race.

There were many valuable prizes, the chief being, of course, the Ulster Grand Prix Trophy, which is to be competed for annually. This trophy was presented to the Club by the Anglo-American, Shell-Mex,

Ireland's Premier Road Race.—

and British Petroleum Oil companies. Mr. J. D. Shaw presented a gold medal for the competitor who displayed most pluck and endurance.

The winner's impressions of the event are particularly interesting, for he has this year ridden in the Senior T.T. Race, the French Grand Prix, and the Belgian Grand Prix.

Hassall describes the Clady course, as the Irish circuit is called, as "of triangular shape with, to be Irish, four sides, the apex of the triangle being flat. There are five bad corners of the Signpost or Craig-na-baa type and several bends needing care.

The Winner's Impressions.

"The rest of the course consists of straights, one being seven miles in length, in this instance mounting in a series of undulating steps for five miles, the final two miles being downhill. The filling up depôt and grand stand are situated just where the downhill portion commences. The surface is rather 'pot-holey,' and constitutes a good test of tyres, frame and forks, and the rider's wrists. In the case of the bad corners safety gaps are left in the form of by-roads, so that in the event of a rider approaching a corner too fast he can take the by-road, turn, and regain the course.

"On the Saturday of the race the course was greasy in places beneath the trees owing to heavy rain earlier in the week, and these by-roads were consequently in great demand!

"The Isle of Man course is, in my opinion, still the finest all-round test, but the Irish course compares very favourably indeed with the French courses at Strasbourg and Le Mans, and is about equal in severity to the Belgian course at Spa."

The event was run on the handicap principle, the limit man receiving one hour from scratch. Hassall says that he would like to pay a tribute to the excellence of the handicapping, the second, third, and fourth men finished within two minutes of himself. Further, he states that the organisation was splendid, all corners being marked with warning boards and banners in an identical manner with this year's T.T. This, together with the very sporting attitude of the local riders, made the event a thoroughly enjoyable one. The entry of seventy-five riders shows the measure of local enthusiasm. For next year's event

Triangular 20½-mile course, over which the Ulster Grand Prix was run.

the roads will be specially prepared, and he is confident that the meeting will be second only in importance to the T.T. itself. His own experience can be summed up briefly as enjoyable, and the o.h.v. Norton ran faultlessly throughout.

W. L. Handley, the O.K. Junior rider, who won the 250 c.c. class, only left Birmingham on the Friday afternoon prior to the race on Saturday.

No Severe Climbing.

After travelling overnight, he took a quiet trip round the course on Saturday morning. He considers that it was quite a sporting one, with a few very fast stretches, but that these fast stretches only accentuated the roughness of the roads. It was a top gear course, but quick deceleration and acceleration were required for the four or five bad corners. He praises the marshalling particularly.

"I cannot pretend," states Handley, "that the Ulster race is as important as the T.T., but, taken all round, it is a very sporting event which ought to be perpetuated.

"I am very pleased that I participated; I am more than ever pleased with my machine. I took a bad tumble and bent a rib or two in the second lap taking a corner a bit faster than I ought to have done through lack of knowledge, but, notwithstanding this, I am glad that I went and glad I won my class."

COMPOSITION OF CARBON DEPOSITS.

IT is generally assumed that the carbon deposit formed inside a motor cycle engine consists almost entirely of burnt oil and of soot from incomplete combustion of the fuel. But it is to be expected that there will be present an appreciable amount of mineral matter, derived mainly from ordinary road dust. That this is actually the case is shown by some figures of the writer's. The deposit obtained from the piston head of a big twin when analysed was found to give, on ignition, 12.8% of ash, which means that only 87.8% was actually carbon or burnt oil. The ash, on analysis, gave the following figures:

Silica	43.0%
Iron, as Fe_2O_3	48.1%
Undetermined	8.9%

Thus 43% of the mineral matter present, or 5.5% of the original deposit, was composed of silica, and the whole of this was undoubtedly derived from road dust. It should be noted that the carburetter was an old-type Amac, fitted with a dust trap, but no gauze for filtering the air taken in. The origin of the iron is not quite so clear. Apparently it must have come from the cylinder or piston, most probably from the piston head.

Another curious fact worthy of note is that a small trace of copper was also found, although its source is not at all clear unless some element in the fuel had a solvent action on the petrol pipe.

G. MIDDLETON.

ALT-Y-BADY.

How to Climb It.

By "One Who Knows the Hill."

IF there is a purgatory for trials riders, almost certainly Alt-y-Bady will be included as a non-stop section. No outside assistance will be allowed. . . .

But enough—the prospect is too nightmareish to contemplate.

There is no doubt about it: the "Bady" is a horrible hill. In fair weather or foul it is invariably wet. It is steep. It is long enough to discourage rushing. Its normal surface is of the consistency and viscosity of a 50-50 mixture of Vaseline and Vacuum T.T., this being nicely plastered over huge irregularly-placed slabs of rock. Yet it should not beat the modern motor cycle.

Gear ratios and tyres both are all-important.

A simple formula infallibly gives you a low gear ratio:

$$\frac{W\,M \times W\,R}{C \times K}$$

Where: W M = weight of machine in pounds.
W R = weight of rider in pounds.
C = capacity of engine in cubic cm.
K = a constant of 10.

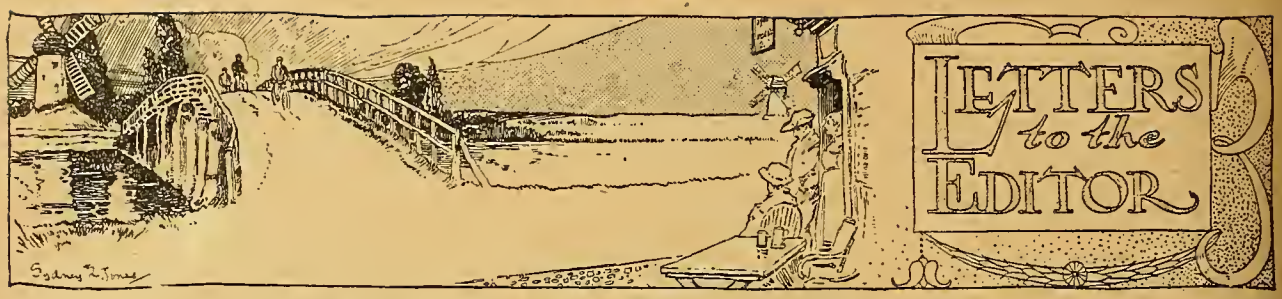
N.B.—Another method substitutes "of rider" for "of engine" under C and requires other modifications, but does not usually apply when the lunch stop is at Llangollen.

I am not so sure as to what (or who) gives you tyres, but they must be of the right pattern. If you have previously failed on the three-ribbed type, try the studded variety, or *vice versa*. These should be brand new at the commencement of the trial, although one of the best ascents I have ever witnessed was made on an old twin with a perfectly smooth rear cover.

The best speed to take the hill at should be decided upon beforehand; it is inadvisable (and sometimes impossible) to touch the throttle lever later on. While it is not much use trying to steer an arrow-like course, it is not considered good practice to try to ease the gradient by zig-zagging.

I am convinced that the man who carries out these instructions faithfully need never fear Alt-y-Bady. Myself, I always start the climb full of confidence—doubt is fatal—and one of these days I hope to make a clean ascent.

Three styles of attempting Alt-y-Bady. Only the middle rider was successful.



The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4., and must be accompanied by the writer's name and address.

BEST IN THEIR CLASSES.

Sir,—We think that your correspondent has embarked upon rather a bold enterprise when he tries to classify motor cycles. We suggest that perhaps the Indian might receive a little attention in the 1,000 c.c. class. In the 500 c.c. category the Norton might perhaps be included. As for the 350 c.c. list we note that a machine which has won four consecutive T.Ts. and one senior T.T. is omitted; and also the 250 c.c., the Levis, which has done some very good work, has failed to appear. G.J.S.-O.
Winchester. L.T.L.

Sir,—Though by no means favouring a slow machine myself, I am certain that most motor cyclists put reliability before speed. I do not mean to insinuate that *all* reliable machines are slow, or that a machine cannot be both speedy and reliable. But I think most riders are willing to sacrifice a little speed for greater reliability.

I consider it an impossible feat to make a list of the finest solo machines accurately. For example, I think the 550 c.c. Triumph should be included in the finest 750 c.c. machines, if reliability is to be considered. Yet I am of the opinion that the three machines which are considered best in the 750 c.c. class, are worth their place.

May I also suggest that it would be hard to find much better 350 c.c. machines than the A.J.S., Douglas, and New Imperial? A. HARTLEY.

Sir,—Your correspondent errs somewhat from the accepted meaning of solo machine. His list is apparently that of fast sports models and racing 'buses, and perhaps if he had enquired further than his own select circle he would have probably heard of such motor cycles as the 499 c.c. Triumph and the 349 c.c. A.J.S.

Assembled machines, even if they have overhead valves, are not *always* accepted as the best machine.
Cheshire. XELA.

Sir,—On the whole I agree with the selection of the three best solo machines in each class formulated by a correspondent recently, but in my opinion a few alterations are necessary. Judging by his selection, I should imagine that he was a bit of a speed merchant; let us have a few touring machines on the list as well. The following is my selection:—

1,000 c.c. class:	(1) Super-sports Zenith-Jap.
	(2) S.S. 80 Brough Superior-Jap.
	(3) Super-sports Matchless-Jap.
750 c.c. class:	(1) Humber.
	(2) 650 c.c. Zenith-Jap.
	(3 550 c.c. Triumph.
500 c.c. class:	(1) 499 c.c. Triumph.
	(2) Sunbeam.
	(3) N.U.T.-Jap.
350 c.c. class:	(1) Beardmore-Barr and Stroud.
	(2) Hawker-Blackburne.
	(3) A.J.S. (Model B2).
250 c.c. class:	(1) Holroyd-Jap.
	(2) Levis.
	(3) Velocette.

I can only think of one really bad motor cycle. After all, what is the definition of a bad machine? I should like to hear some of your readers' opinions on the subject.
London, N.W.11. REVS.

Sir,—A correspondent considers that in the 500 c.c. class the first, second, and third best standard machines are:—
Long-stroke Sunbeam.
O.h.v. Douglas.
Scott-Squirrel.
I think that his friends have not heard of any other motor cycle in that class, so may I suggest:—
1. Long-stroke Sunbeam.
2. O.h.v. Triumph.
3. Norton.
Also may I suggest that in the 1,000 c.c. class that the third best is a Sports Indian? RICUMPH.
Worcester.

Sir,—I have attempted to formulate my idea of the three best solo machines in each class. But to quote the Latin saying—*quot homines tot sententiæ!*

1,000 c.c.:	S.S. 80 Brough Superior.
	O.h.v. Trump Anzani.
	Super-sports Zenith.
750 c.c.:	80 m.p.h. Coventry Victor.
	Quick Six Martinsyde.
	75 m.p.h. Trump-Jap.
500 c.c.:	Long-stroke Sunbeam.
	O.h.v. Norton.
	Sports Sunbeam.
350 c.c.:	O.h.v. Massey-Arran.
	O.h.v. Rex Acme.
	O.h.v. New Scale.
270 c.c.:	Francis-Barnett.
	O.h.v. Reyre Newson.
	New Comet Climax.
250 c.c.:	O.h.v. Coventry Eagle-Jap.
	O.h.v. Cotton-Blackburne.
	Grindlay.

RONALD C. H. RUSSELL.

THE ETHICS OF "HANGING-ON."

Sir,—Regarding Mr. Thorpe's reply to my letter, he would do well to remember that sarcasm can never take the place of logic.

He taxes me with "sheer ignorance." What is the tractive resistance (*i.e.*, resistance due to friction) of a vehicle travelling 30 miles per hour as compared with that resistance at 1 mile per hour? It is exactly the same. Tractive resistance is always expressed at the rate of so many pounds per ton, and has no relation to speed. Now what is the resistance of the *air* at 30 miles per hour as compared with 1 m.p.h.? It is roughly 900 *times as great*, as it increases as the square of the speed, approximately. In the case of a bicycle, with its ball bearings, etc., the tractive resistance due to friction is absolutely negligible when compared with the enormous increases of air pressure and air friction at the higher speeds.

If Mr. Thorpe continues to doubt my statement, let him compare the big differences between paced and unpaced cycling records: tractive resistance is the same in both cases: wind resistance is the only cause of the differences.

In spite of assertions to the contrary, there are large numbers of road users who object to being used as pacers, from one reason or another; and the least that would-be "hangers-on" can do is to desist when civilly requested to do so. BENEDICT.
High Wycombe

LARGE TYRES ON SMALL MACHINES.

Sir,—I would like to disagree with Mr. Houlding, who says that the small tyre has had its day on 250 c.c. machines. I took delivery of a Velocette early this year, with 24×2¼in. tyres, and in 3,000 miles' running I have had one puncture in the driving wheel and no bursts over all kinds of roads, mostly bad. TOUCHWOOD.

Seacombe.

DEFICIENCIES OF THE HIGH EFFICIENCY ENGINE

Sir,—The present boom in small "high-efficiency" engines, and the letters recently appearing in *The Motor Cycle* from enthusiastic owners of such machines who have ridden nothing bigger, warrant, I think, a few words from the other point of view. What on earth is the point of this craze for cutting down engine capacity to its utmost limits at all costs, and fitting multitudinous gears to compensate for lack of "pep"? I suppose it is to some extent due to an entirely erroneous popular notion that the smaller the engine the smaller the petrol consumption. The petrol consumption depends on the work done and, all other things being equal, has nothing whatever to do with the size of the engine. More than that, considering oil, tyres, and replacements, a small sidecar outfit is actually *more* expensive to run than a big one—granted, of course, equal and similar usage in in both cases. I am speaking from actual personal experience. *Of course* a 350 c.c. machine can do the "work" of a 500 c.c. one. A 350 c.c. Douglas engine, given adequate cooling and sufficiently low gear, could propel a fully loaded Rolls-Royce up Porlock hill; "work," however, takes no account of time, and most Rolls-Royce owners retain the 50 h.p. unit supplied by the makers.

The spectacle of an unfortunate engine of totally inadequate capacity screaming itself hoarse on a 6-1 top gear simply makes me ill. For serious long distance fast touring, the small high-efficiency machine is an impossible proposition owing to lack of reserve power, in all but the most favourable conditions; and it is unnecessarily complicated for pottering round town or golf links, for which a small two-stroke is far better.

I have in mind two 1911 "8 h.p." Chater-Lea outfits my family owned before the war. With the old type B. and B. carburetter they used to take a passenger and luggage 70 m.p.g. regularly, and at best would take the same load up Red Hill (near Bristol) on top gear (3⅞-1, ye high-rev. merchants!). Experiences with a 595 c.c. Douglas (1920) outfit led me to discard the sidecar, fit a Warner rear spring frame (£1 at Grose's and a gift at the price!), a Brooks' B500 saddle, revised oiling system, and B. and B. carburetter. And I now have an admirable solo 'bus—geared 4¼-1, and a pleasure to drive.

In conclusion I can only repeat what others have said—that no one having *tried* a big, woolly, flexible engine will ever go back to the small high-rev. type. My next mount will be a 976 c.c. (belt) Zenith, solo.

Usual disclaimers. A.E 8675.

London, S.E.1.

GOGGLES FOR THE SPECTACLED RIDER.

Sir,—I would like to thank Mr. Ellis for the suggested form of goggle, and I intend to have one made upon these lines. I trust he will not object. Mr. Ellis has not mentioned one very good point; that is, the optical conditions in the glass are common to both eyes, when the goggle is in any position—a most important point but generally impossible with the ordinary goggle. I hope "Awakawakawa" adopts this suggestion, too, but I hope he does not go for a prescription! Any working optician will work the window plane and parallel and give him perfect satisfaction.

In reference to Mr. Freeman Lee's letter, I think he has not noted that "Awakawakawa" wishes to wear his present spectacles, therefore I think he will agree that many things he has written should have been omitted.

In view of the contents of his second paragraph he must agree with me upon the most obvious fact that lenses cannot be satisfactorily fitted to goggles. Then why advise us to consult a qualified optician?

I therefore reiterate the advice I gave your reader and would add that if the vision is unaided use plane (not plain) windows properly made by an optician. If the vision is aided keep your spectacles in use and again fix plane windows to the goggles.

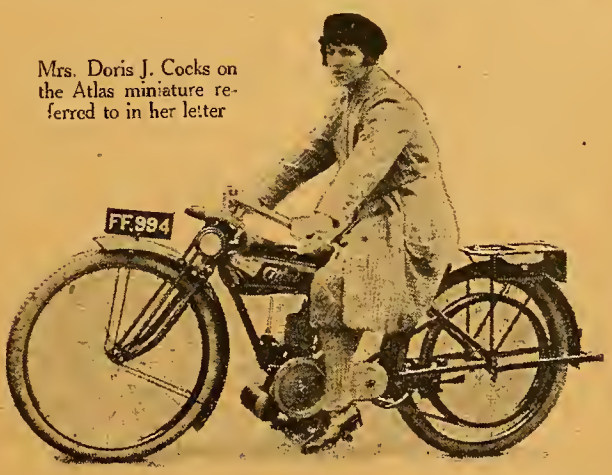
Mr. Lee's experiences are quite interesting, but more details are required for criticism, and the errors of perspective attributed to variation in the refractive index can be dismissed. ROVER.

London, N.W.19.

THE MOTOR CYCLE FOR THE MASSES.

Sir,—I can quite endorse your editorial remarks, but do not think you have put the case of the real miniature motor cycle as distinct from the motorised bicycle strongly enough; from practical experience I have far greater faith in the eventual popularity of the former.

I have for a considerable time been using an Atlas miniature motor cycle, which is fitted with an engine of 142 c.c., and weighs, as originally delivered (a single speed model) to me, 95lb. In this form I ran it for some hundreds of miles in North Wales with every success; later I fitted a plain two-speed gear box supplied by the manufacturers. This fitting has made the machine an absolutely go-anywhere mount, and at a really good average. I have no difficulty whatever in maintaining a speed in excess of the legal limit over long distances, and can do nearly 40 m.p.h. on decent roads when necessary. I have surprised many owners of considerably higher powered machines with the speed my little mount is capable of attaining. Petrol consumption works out at about 150 m.p.g., and the oil consumption is practically negligible as the petroil system is used. I am convinced that there is a large number of people who will welcome a machine of this type as a cheap means of transport for business or pleasure. For my own part, I use it in



Mrs. Doris J. Cocks on the Atlas miniature referred to in her letter

the course of my business as a commercial traveller to cover about 400 miles of road per week, I have done well over 100 miles in a day, making business calls in five towns in this distance. I think your suggestion that the A.C.U. should create a new class for machines under 150 c.c. an excellent one, and hope you will do your best to bring this into existence, when there will be one more milestone in the history of motor cycling, established by the foresight and energy of *The Motor Cycle*.

(Mrs.) DORIS J. COCKS.

THE ROOT CAUSE OF KNOCKING.

Sir,—I was very much interested in the article on "Knocking," by "G.T.C." Whilst appreciating his explanation, I think he has not made himself sufficiently clear and misses the main controlling factor of detonation.

It is the rate of burning of that portion of the charge first ignited upon which detonation primarily depends. No doubt a compression wave of more or less intensity is always present during the first stages of combustion. It is only when this *rate* of burning is abnormal that the expansion,

and in turn: compression, is such as to cause detonation or the instantaneous combustion of the whole of the remaining charge. If detonation is allowed to continue overheating of such insulated parts as the plug points will cause pre-ignition.

Much of the reverberatory action of detonation can be damped out by proper designing of the combustion head. Compactness, freedom from small pockets, no long parallel surfaces will go far towards eliminating heat and sound from being concentrated by reverberatory action. The sparking plug should be so situated as to give the shortest possible flame travel. The A.J.S. 1921 T.T. model is a striking example of what I mean, and the sectional elevation in your July issue of that year will show the main points I have mentioned.

It is a well-known fact that an admixture of benzole or cool exhaust gases to the charge, at the carburetter, will in most cases eliminate altogether this complaint. The thermal efficiency will not be reduced to any extent unless the complaint has become chronic. These, I think, are two immediate remedies that will be found more suitable and effective than those given by "G.T.C." Most of these facts were taken from Mr. Ricardo's latest papers.

Middlesbrough. ANTINOK.

SCHOOLBOYS AND TAXATION.

Sir,—I should like to point out another side of the unfairness of the present system of taxation. I am one member of a rapidly increasing class of motor cyclists—that is, schoolboy motor cyclists. Not being allowed to have my machine at school, I use it, roughly, for fourteen weeks in the year, for which I pay £3 taxation. A. HARTLEY.

T.T. RACES FOR SMALLER MACHINES.

Sir,—Your arguments in favour of T.T. races for smaller machines, presumably excluding the 500 c.c. type, have, I fear, little justification.

It is incorrect to infer that the 500 c.c. machine has reached perfection. Excellent as they may be, all the 500 c.c. machines on the market to-day would benefit by the lessons of many future races.

The public may not want 80 m.p.h. motor cycles in any quantity, but they do want something capable of an occasional 60 m.p.h. The makes that can be relied on to reach that mark without being at the top pitch of their tune can be counted on the fingers of one hand.

Anyhow, manufacturers do not enter the T.T. to improve their designs; they enter for advertisement. Therefore, unless the races are to become like an American trade publicity rally, the element of sport must also be retained. Talk too much about improving the breed and you lose the support of the true enthusiast. That the tourist's machine has been developed is a very incidental result of the T.T. races. It will be time enough to say it has been fully developed when 100 per cent., not 30 per cent., of the starters finish in a T.T. race.

My 499 c.c. Plonk-plonk is a very delightful machine, but if I drive it hard things begin to happen to the valve gear and cylinder head. Three more T.T.'s should put these things right. PIP-SQUEAK.

London, N.W.8

SANS CHAINS, BELTS OR GEARING.

Sir,—It occurs to me that there is a type of transmission which (as far as I am aware) has never been tried upon motor cycles.

I refer to "side rods," such as are used to "couple" the driving wheels of locomotives. Through the medium of crankpins 90° apart, on each pair of wheels, coupled together with "side rods," the driving effort is distributed amongst two or more pairs of wheels.

Normally, of course, they also help to distribute the tractive effort, and thereby to prevent the wheels "spinning" on "greasy" rails. That they do, in fact, keep the wheels in synchronism, is obvious.

An adaptation of the "side rod" principle is used on the 8-cylinder Leyland engine, to drive the overhead camshaft. In this case three "rods" are used, coupling together the driving and the driven eccentrics, which are set 120° from each other.

Obviously, it would be impossible to obtain any reduction of ratio between gear box and back wheel, such as is now available when either belt or chain is used, but this could be overcome by setting the engine with its crankshaft "fore and aft," and providing the necessary reduction by worm gearing, as is already done on the Cleveland two-stroke.

With ball or roller bearings to the eccentrics or cranks, and light I section rods, it seems that a no-trouble transmission could be evolved. With an adaptation of the knock-out type of axle wheel removal ought to present little difficulty. With eccentrics spaced 120° apart there would be little unbalanced stress upon the cycle frame.

A further use of this type of transmission could be found in using it for the magneto drive, thereby eliminating the chain or the train of spur pinions.

Obviously there are also some disadvantages, when used for the "final drive" from gear box to back wheel, such as "lopsidedness," but then, after all, present systems suffer from this to a certain degree.

In the present instance it could be overcome by duplicating the "rods," which could then be made lighter.

Montgomery. SIDEROD.

BRITISH BIG TWINS FOR AUSTRALIA.

Sir,—It may be of interest to Mr. Moule, who wrote the letter entitled "Why?", to know that the Brough Superior Australian Service is already established in Sydney. The model I am producing for this market has an increased ground clearance and several features which are required for colonial purposes; and I am sure when Mr. Moule has seen and tested one of these machines for himself he will not again ask "Why?" GEORGE BROUGH.

HUMIDITY AND POWER OUTPUT.

Sir,—In respect to a letter in *The Motor Cycle* of October 12th on Humidity and Power Output, "M.B.B.H." bases his argument on the fact that the humid atmosphere is more dense than a dry one. I would like to point out that this is not the case, as witness the barometer falling in wet weather. Should his argument hold, we should expect to have the barometer rise on wet evenings. J.H.H.

York.

SUMMARY OF CORRESPONDENCE.

Cadet J. R. Bryans desires a light sporting sidecar suitable for fitting to a 349 c.c. A.J.S., but with a fairly large and comfortable torpedo or Zeppelin-shaped body. We pass the query on to our readers.

Waders at the price of overalls are wanted by "C.A.," who asks if readers know of a firm that supplies these.

"A.J.S." (Worcester) thanks the rider of OK 1323 for assisting him with magneto on the 14th inst.

Pot-holes filled with sods on the Corwen-Bettws road are complained of by Mr. G. W. Pigott.

Books & Maps for Motor Cyclists.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., Dorset House, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

CURRENT CHAT

This Week's New Offence.

Examining a reader's machine after a slight street accident, a zealous member of the Metropolitan Police Force discovered that the licence-holder glass had been cracked. A summons is expected.

No Wonder it is Fast.

The eight-valve M.A.G. engine which O. M. Baldwin entered in the 1,000 c.c. championship race last Saturday was hurried over from Geneva by aeroplane by M. Neher, head of the M.A.G. concern. It is said to develop 25 per cent. more power than the previous engine of similar design.

More Furious Calculation—

According to the evidence of a Sheffield policeman in a noise prosecution, the offending machine passed him at 30 m.p.h., making a loud and continuous noise; the exhaust pipe had a perforated fish-tail, with two rows of little holes, 18 in number. He was asked if he had deliberately counted them as the defendant passed at the stated speed; the reply was in the affirmative.

—and Still More.

"Defendant drove his motor cycle round the Wellington road corner at a speed of about 80 miles an hour"—extract from newspaper report of police court proceedings at Newport (Salop). Since the corner is a right-angle bend and the machine was a 1914 Douglas, the witness was no doubt wise to qualify his estimate as approximate; possibly he is a motor cyclist himself!

A French-made Morgan Engine.

It will be news to a number of our readers that the popular Morgan, which is manufactured under licence in France by M. Darmont, is now equipped with an engine built by him at his works in Paris. Hitherto French-made Morgans have been fitted with J.A.P. or M.A.G. engines, but the heavier costs of production in England, the high tariff, and the present rate of exchange has compelled the manufacture of the French engine.

The Amenities of Cambridge.

There are probably more motor cycles in Cambridge than in any other town of the same size in the world. Recently, in an evening paper, a Mr. Jephson heartily condemned their use. In a reply an undergraduate of Magdalene writes: "A learned professor may be seen travelling down King's Parade on a two-stroke any morning aboupt 10 o'clock He seldom averages more than 4 m.p.h., and the machine makes a noise like a railway accident." "Surely," the writer adds, "Mr. Jephson would not deny the old gentleman this modern means of progression?"

Record Breakers Busy.

The Brooklands racing season this year has terminated early, but there will still be intense activity amongst would-be record-breakers right up to show time.

Cowed.

Recounting some of his experiences in *Motor Transport*, an old-time haulage contractor tells how after starting with his first steam waggon a farmer came to see him one day and assured him that since the advent of the lorry his cows were not giving anything like their previous quantity of milk. Instead, their blood curdled.

One number plate must be illuminated as above *vide* Road Vehicles Registration and Licensing Order (1921). According to the Lights on Vehicles Regulations (1903) the lamps ordinarily required by law may be lit half an hour later.

Sunday Competitions.

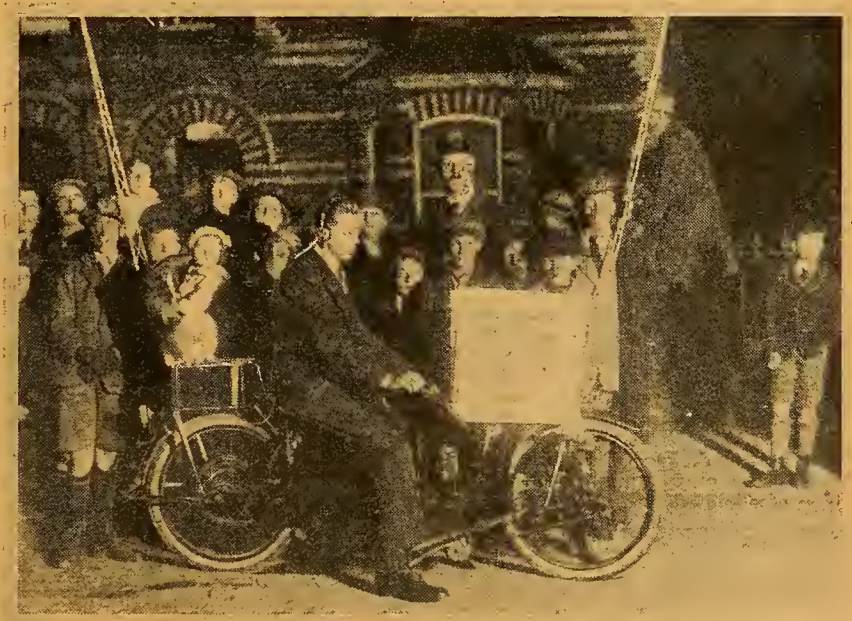
In agreement with *The Motor Cycle*, the A.C.U. has not hitherto encouraged Sunday competitions of any sort. It is a pity, therefore, that the officially observed ascent of Alms Hill by a 292 c.c. O.K. Junior (described in "Club News" last week under Oxford M.C.) could not have been arranged for a Saturday.

Motor Traffic in Guernsey.

In view of the smallness of the island of Guernsey, which has been described as being largely composed of hills and corners, it is an extraordinary fact that there are no less than 1,377 motor vehicles, of which 570 are motor cycles. As there are very few accidents it would seem that Guernsey drivers are particularly careful.

It is never too late——.

Riding on the carrier of a motor bicycle for the first time, James Harding (age 72), of Pyford, Surrey, was summoned at Kingston recently for aiding and abetting the driver in obscuring the rear number plate. The police constable stated that the rear number plate was obscured by Harding's coat. The summons was dismissed on payment of costs.



WIRELESS ON A SOLO MACHINE. A participant in a Basingstoke torchlight fancy dress parade carrying a wireless outfit on his Ner-a-car.

THE MOST POPULAR MACHINES.

Census taking by our Readers in Various Parts of the Country.

ENCOURAGED by glorious late autumn weather, census-taking by our readers has been a popular pastime during the last week or two.

The results to reach this office in response to a recent "Current Chat" paragraph make interesting reading and indicate that although a machine may be comparatively popular in one district it may be almost unknown in another.

SMALL PLUGS FOR LARGE ENGINES

FROM time to time diminutive sparking plugs have appeared on the market to meet the special needs of designers of very small engines, or for machines with insufficient clearance between cylinder head and frame tubes. Last year the Runbaken firm produced a miniature plug which is in the first category, while a dwarf plug was once catalogued by the Sphinx Co., which was of the latter type.

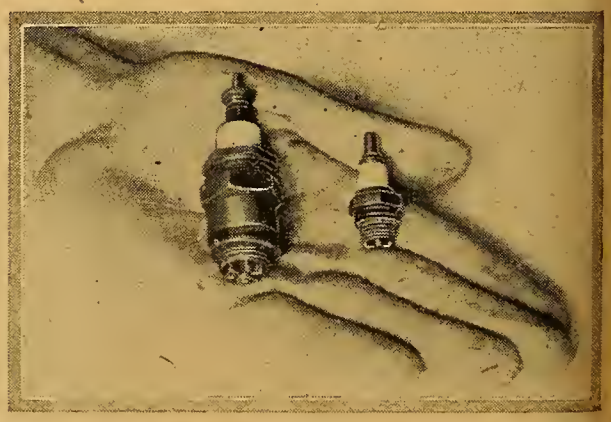
In all such cases, however, these small plugs have not been claimed to be superior to the standard types, and no speed exponent would have considered using them for present day racing.

We cannot recall having heard an opinion expressed that small plugs might be more satisfactory than the large type, until the recent Paris Salon. It was M. Mathis, designer of the popular Mathis car, who, in presenting us with a diminutive Bosch plug, ventured to claim that the small plug is the future type, *because of the decreased mass of metal it embodies*. M. Mathis was so confident regarding this theory that he has designed his latest engines to take the miniature Bosch plug, which is illustrated in company with a plug of standard size.

The respective dimensions of the two plugs are as follows:—

	Miniature.	Standard.
Length overall	1⅝in.	3in.
Diameter of Body	¾in.	1¼in.
Diameter of Threaded Portion	15-32in.	11-16in.

No doubt there is a great deal in the idea that for hot running engines, a small plug with the minimum amount of metal in the body should be superior to one with perhaps 200 per cent. more metal. It may be argued, of course, that the larger plug body has a correspondingly increased area presented to the air. On the other hand, the small plug has very little area exposed to the flame of the ignited gases, and cooling area on the cylinder head may be increased.



On the basis that the larger a plug the more readily will it overheat, the Bosch company has introduced a miniature sparking plug, around which it is said a Continental manufacturer has designed an engine. The new plug compared with a standard article.

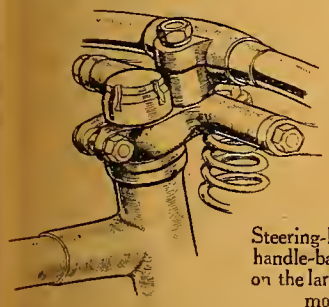
ADVANCE DETAILS OF 1923 MODELS.

NEW B.S.A. SOLO MODELS.

Two Solo Singles and a Light 986 cc. Twin.

QUITE a number of novelties will be staged at the forthcoming Olympia Exhibition on the B.S.A. stand. Of these, two are of considerable interest to solo riders. The first is an entirely new sports model of 80 × 98 mm. (493 c.c.). Outwardly the engine follows B.S.A. lines, but has a specially well-ribbed exhaust port. The long stroke engine has a light cast-iron piston, roller-bearing big end, ball bearings on the driving side of the main shaft, and a plain bearing on the timing side. Separate cams are employed to operate the inlet and exhaust valves, with rockers interposed, and a special screw type oil pump is incorporated in the timing cover, the lubricant being pumped through a sight feed drip and thence to the engine.

The lines of the machine are distinctly sporting and graceful, the frame having a comparatively short wheelbase and a three-speed gear box being housed above the bottom bracket. The drive is by chain throughout, a faced cam type of cush drive being mounted on the engine shaft. Having a rounded nose and tapering slightly to the rear, the tank is pressed from sheet brass and is well rounded at the edges and corners. Below the Brooks



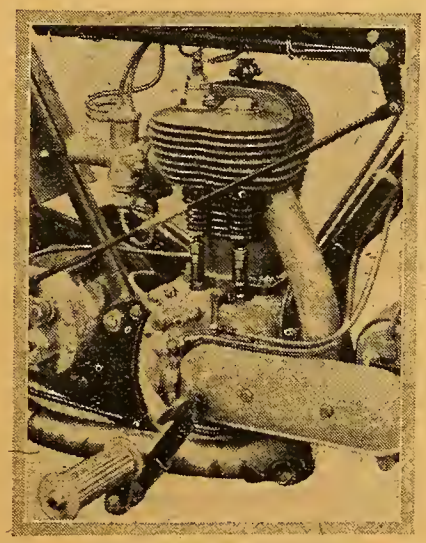
Steering-head and handle-bar fixture on the larger sports model.

short-leaf spring saddle and behind the down tube lies a large armoured tool bag. The rubber-covered foot-rests are adjustable to any position; the adjustment is simple, for the cranked rests are mounted on a hexagon bar which fits through a correspondingly "drifted" lug, so that it is only necessary to remove the rests and slip them on in the desired position.

Mudguards of D section and moderate width are fitted.

There is a small modification from B.S.A. practice incorporated in the gear box, for the main shaft now lies in front of the lay shaft and the box is somewhat neater than in previous models.

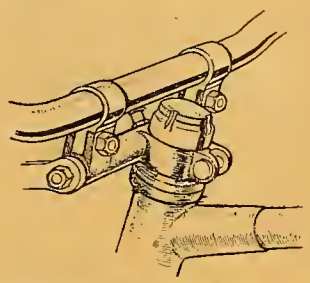
A similar gear box is fitted to the new 349 c.c. B.S.A., the engine of which has a bore and stroke of 72 × 85.5 mm. This, again, is a new model, and is to a certain extent a small edition of the 493 c.c. sports machine just described. The valves are placed side by side, and a similar type of screw mechanical oil pump is employed.



Engine of the new 493 c.c. sports model.

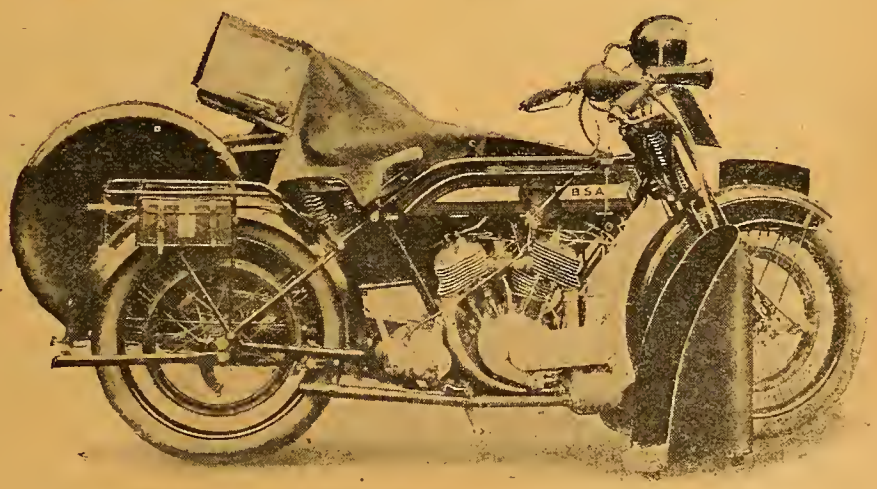
In the smaller model 26 × 2¼ in. tyres are fitted, as compared with 26 × 2½ in. on the larger model. Also the front mudguard is fully valanced, and is fitted with a sensible mud splasher. The chain cases are of pressed aluminium, the front chain being fully protected, while the top run of the rear chain is well covered. Again, the tool bag is behind the saddle tube, and a dummy belt rim brake is fitted to the rear wheel.

The handle-bar fixings are quite a feature of these two B.S.A. models. In the



Handle-bar fixing on the 349 c.c. model.

case of the smaller machine no stem is fitted, but a special type of lug is bolted direct to corresponding lugs on the link bearing of the spring forks. The sports model, however, has an adjustable bar gripped in a split clip which forms the upper part of the head lug.



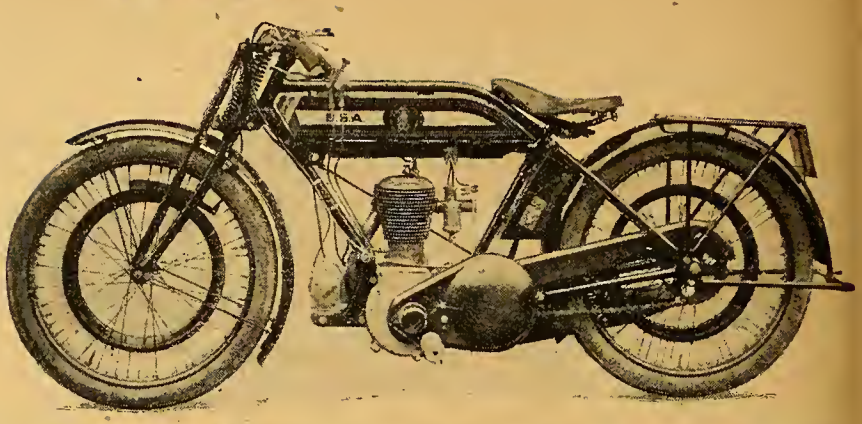
Foot-boards and leg-shields are instantly detachable on the "Light Eight" sidecar outfit.

Advance Details of 1923 Models.—

Another new model is the "Light 8," which has a twin-cylinder engine of 80 × 98 mm. bore and stroke (986 c.c.). This engine is very neatly housed in a slightly modified form of the "Light 6" frame.

For Fast Sidecar Work.

Fitted with 700 × 80 mm. tyres, the machine is a very attractive fast sidecar mount. It incorporates most of the well-known B.S.A. features, including mechanical oil pump, good mudguarding, excellent finish, and mud-proof tappets. The drive is, of course, by chain throughout, a three-speed gear box being employed. The rear wheel is of the quick-detachable type, and a choice of Terry saddle or a normal saddle with B.S.A. spring seat pillar is provided. Both brakes operate in dummy belt rims, and a Mills single-lever carburetter can be fitted as an option to the standard two-lever type.



Mechanical lubrication and effective chain guards are features of the 493 c.c. sports model B.S.A.

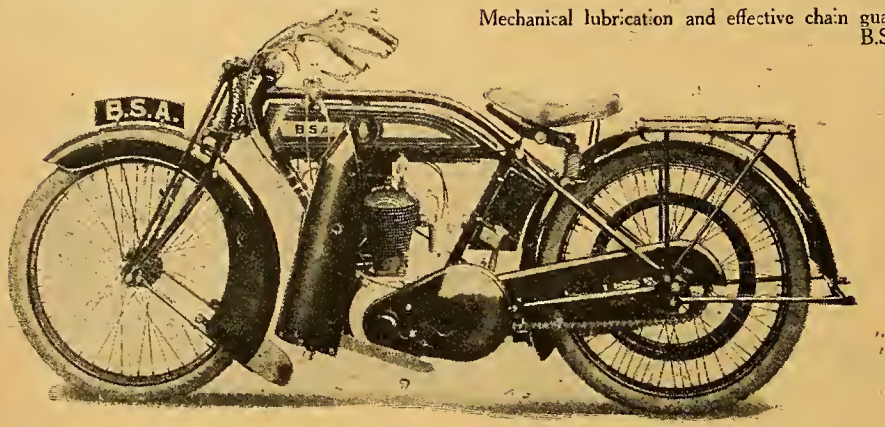
The well-known 557 c.c. single-cylinder B.S.A. remains unaltered, both in all-chain and chain-cum-belt models.

Double Purpose Twin.

The "Light 6" is obtainable as before, or it may be purchased in a modified form with chain guards only as opposed to the cast aluminium chain cases and without the spring seat pillar.

The big twin touring model, with its many refinements, is also unaltered.

Neat detachable foot-boards and leg-shields can be obtained with all touring models.



Protective leg-shields are included in the equipment of the touring 349 c.c. B.S.A.

NEW CONNAUGHT MODELS.

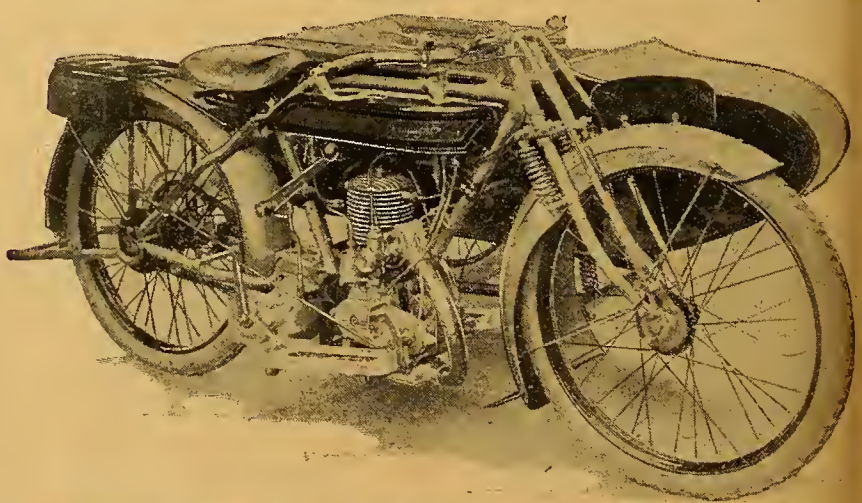
Increasing Popularity of 350 c.c. Two-Stroke Models for Solo and Sidecar Work.

As emanating from one of the earliest constructors of two-stroke motor cycles in this country, any new production from the Connaught factory is bound to create a considerable amount of interest.

At the 1921 Olympia Show a 350 c.c. Connaught was introduced, and the engine of this size has undergone considerable developments during the past year, and in its latest form has become an attractive machine for either solo or sidecar work.

Combined Inlet and Exhaust Manifold.

Having a bore and stroke of 76×77 mm. (348 c.c.), the engine has the combined inlet and exhaust manifold which has so long been a feature of Connaught practice, but this feature has been modified considerably in design. In the case of the sports model, the manifold consists of two aluminium castings bolted together and heavily ribbed in order to dissipate the heat. The castings surround the front down tube, and thus there is no need for complicated bends in the pipe; from this manifold the exhaust pipe leads to a cast aluminium expansion box carried on the chain stay containing a simple and effective baffle, which, however, does not reduce engine power perceptibly. Silencing is a feature of the latest Connaught models, and in the standard 350 c.c. machine a modified form of cast aluminium manifold directs the gas into the exhaust pipe, whence it is led to a flat aluminium silencer directly below the crank case. From this silencer there are two exit pipes, to which the gas finds its way through a series of holes, the noise being very considerably reduced; in fact, as a result of a demonstration we are convinced that no one could take exception to the noise of the

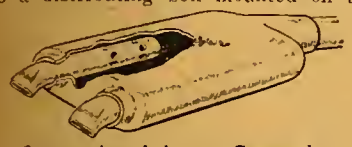


Standard 348 c.c. Connaught with the maker's own sidecar. Note wide splayed mudguards and position of brake pedal.

Advance Details of 1923 Models.—

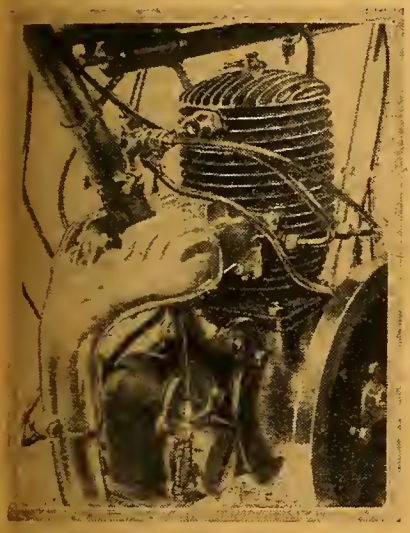
latest Connaught under any circumstances, for even on full throttle all that is audible is a pleasant purr.

In both sports and standard models lubrication is effected by means of a Showell pump driven from the magneto spindle; oil is drawn from the tank and pumped through a sight-feed indicator into a distributing box mounted on the

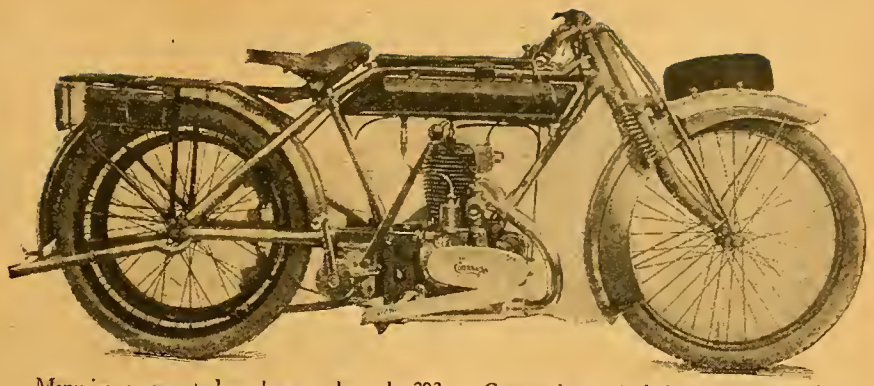


Construction of the new Connaught silencer which lies below the crankcase.

front down tube; from this box a lead is taken to each of the main crankshaft bearings and thence to the big end through the drilled shaft. In addition to this, a lead passes to the cylinder walls and gudgeon pin, and another to that portion of the cylinder wall which



Combined exhaust and inlet manifold on the sports model Connaught.



Many improvements have been made to the 292 c.c. Connaught, particularly in engine details.

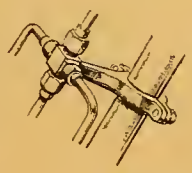
separates the inlet and exhaust ports. It has been found that this last-mentioned lead has a great effect in reducing the possibility of piston rings sticking.

The sports machine is fitted with a two-speed Burman gear, clutch, kick-starter, and all-chain drive, while similar transmission is employed on the standard model with a three-speed box. 26in. × 2½in. extra heavy tyres, internal expanding brakes front and rear, and a simple and neat form of adjustable handle-bars are features of the machine. In addition, the standard model has very neat aluminium footboards, the foot brake pedal passing through the front end of the board and lying in an unusually convenient position. Excellent mudguarding is provided—and the valances of the front guards are splayed outwards at the back, and in addition have a wide mud flap.

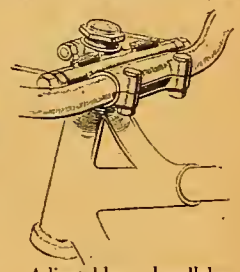
The Connaught tank on the 350 c.c. models is of a new pattern with rounded front, tapering slightly to the rear. Cast aluminium chain guards are fitted, and a further refinement has been effected in the construction of the relief valve, which is now entirely enclosed, while the gases are led through a cast duct into the exhaust port.

In addition to these two types, two 293 c.c. models (73×70 mm. bore and stroke) are manufactured. The first of these has a new exhaust manifold and silencer, a two-speed Burman gear box with clutch and kick-starter, chain and belt drive, two belt rim brakes on the rear wheel, and 24in. × 2¼in. tyres. The second model is a single-geared machine with direct belt drive and an improved frame. These two latter types will be marketed in view of the demand for low-priced motor cycles, and will represent good money value.

A new production will be exhibited at Olympia in the sidecar attached to the



Oil distributing box mounted on the down tube of the Connaught. A Showell pump provides the oil.



Adjustable handlebar and braced head lug of the 348 c.c. model.

350 c.c. standard model. Every part of this sidecar is manufactured by the Connaught firm, so that it is in every way suitable for use with the machine. It has a neat underslung chassis with a three-point attachment, while the body is of comfortable proportions, having a deep back and a sensible locker behind the seat.

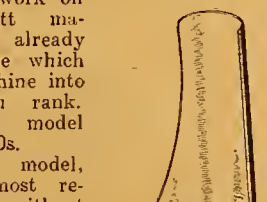
CHAIN DRIVEN FRANCIS-BARNETTS.

292 c.c. and 346 c.c. four-strokes for 1923.

NOT very many modifications have been found necessary to the existing Francis-Barnett models. The chief change, however, will lie in the fact that all-chain drive will be employed throughout. Perhaps the most interesting model, and certainly the most fully equipped, is the standard touring machine, which will have a three-speed Sturmey-Archer gear, clutch, and kick-starter, very wide guards fully valanced in front, and combined footboards and leg-shields, which are quickly detachable by the removal of two nuts. These leg-shields follow the lines of the frame, and are not in any way unsightly, and they are, in addition, most practical fittings. The 346 c.c. J.A.P. engine is, of course, retained, as is the distinctive saddle tank.

The detail work on Francis-Barnett machines has already made a name which lifts the machine into a very high rank. The tourist model sells at £74 10s.

A sports model, similar in most respects, but without leg-shields, etc., is



Combined foot board and leg-shield on the Francis-Barnett.

listed at £72 10s. In addition, the tourist machine can be obtained with a light Grindlay sidecar for £87 10s.; and a special 346 c.c. J.A.P. engined T.T model will be shown at Olympia. This will be stripped, but will have a three-speed all-chain drive with clutch but no kick-starter; it is an attractive mount coloured in grey and mauve. All other Francis-Barnett models are fitted with clutch and kick-starter.

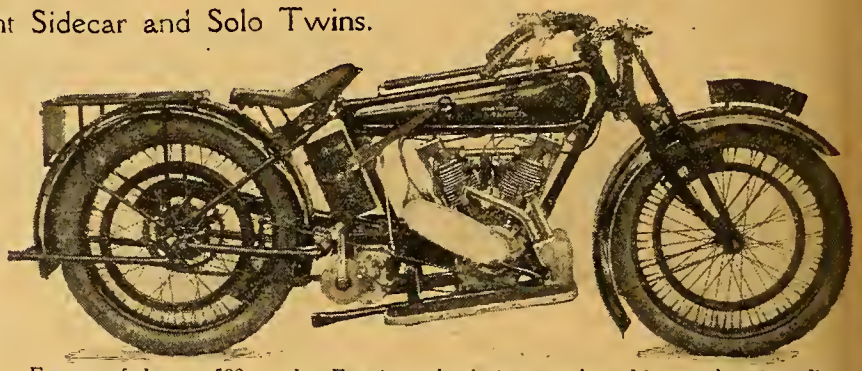
The 292 c.c. J.A.P. engine will be installed in two models, one having a three-speed gear, listed at £65, and one with a two-speed gear at £63 10s.

A small refinement has taken place in the construction of the chain guards, which are now made in two pieces in order to render them more easily detachable.

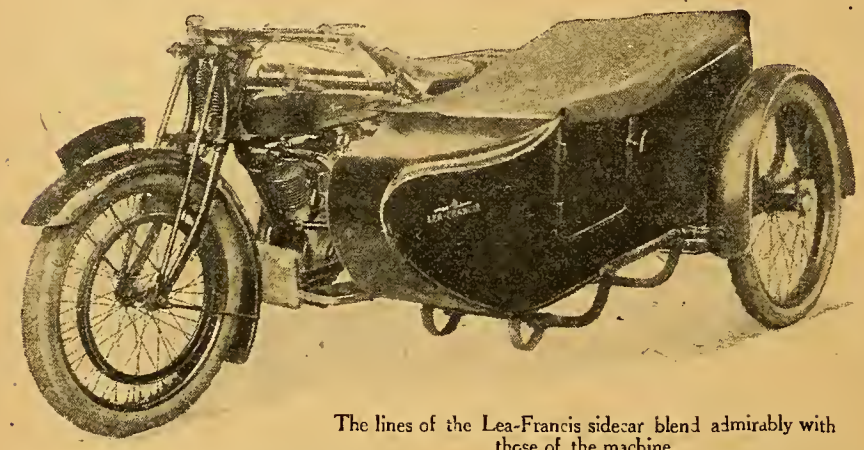
FRAME MODIFICATIONS TO LEA-FRANCIS.

Graceful Medium-Weight Sidecar and Solo Twins.

QUITE an innovation for the Lea-Francis Co. is the fact that in the 592 c.c. model the frame has been modified to the sloping top tube type, thus doing away with the braced head-lug construction hitherto used. The alteration has certainly brought the layout into line with modern ideas, and, enhanced by the admirable finish for which the firm is celebrated, the latest model has a most attractive appearance. The twin M.A.G. engine (64 × 92 mm = 592 c.c.) remains the same, excepting that the magneto is now mounted behind the engine. In addition to this, a three-speed Burman gear box, with clutch and kick-starter, is fitted.



Features of the new 592 c.c. Lea-Francis are the sloping top tube and improved mud guarding



The lines of the Lea-Francis sidecar blend admirably with those of the machine.

It will be remembered that the Burman gear box incorporates a cush drive in the clutch mechanism, but in addition to this an Enfield cush hub is fitted in the rear wheel. Wide D-section guards, without valances, are fitted to both wheels, and a single large armoured tool bag is mounted behind the saddle tube. Fitted with footboards, 26 × 3 in. tyres, and Brampton forks, this machine will be listed at £96 10s.; it is one of the few twin-cylinder models big enough for all sidecar requirements which remains light enough to be handled with comfort as a solo machine.

When a sidecar is supplied, a simple underslung chassis with four-point attachment has been standardised, and the roomy body is suspended on C springs.

The 496 c.c. twin M.A.G.-engined model remains unchanged, except that the head lug has been lowered slightly. Its price is £90.

MOTORISED BICYCLE WITH O.H.V. ENGINE.

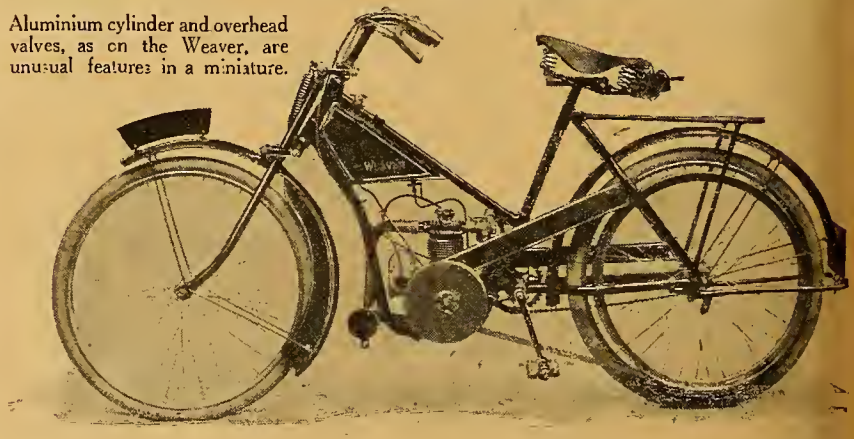
Varied Range of Verus and Sirrah 250 c.c. and 350 c.c. Models and a 150 c.c. Machine with a New Name.

CAREFULLY following the modern tendency in motor-cycle design, the firm of Alfred Wiseman, Ltd., of Glover Street, Birmingham, has decided to market a very complete range of Verus and Sirrah motor cycles, most of which are of the lightweight type.

In addition to these, a pretty little ultra-lightweight will be staged at the forthcoming Olympia Exhibition under the name of the Weaver. This machine will be of the motorised bicycle type, having a sturdy loop frame with sloping top tube, thus providing for riders of both sexes. The engine is a particularly interesting piece of work, having a cylinder of 56 × 61 mm. bore and stroke (150 c.c.). It is of the four-stroke type with cylinder and crank case cast in one piece in aluminium, a steel liner being pressed into the cylinder and a cast iron head being held down by four long studs. Both valves are disposed vertically in the head and are operated by push rods and rockers in the normal manner. A direct belt drive is employed giving a gear ratio of 7½ to 1; a special type of Brampton fork with single central spring provides the front suspension. 26 × 1¾ in. tyres are fitted, and a stand and carrier of sensible proportions are part of the specification. In addition to this, a back pedal coaster brake is fitted. The weight of the complete machine is no more than 70 lbs., and it will be listed at the price of £29 8s.

By careful consideration of production methods, considerable price reductions have been made in the other models of the concern. As an example of this, the 249 c.c. Sirrah may be instanced. This machine is fitted with the latest side-by-side valve 249 c.c. Blackburne engine,

Aluminium cylinder and overhead valves, as on the Weaver, are unusual features in a miniature.

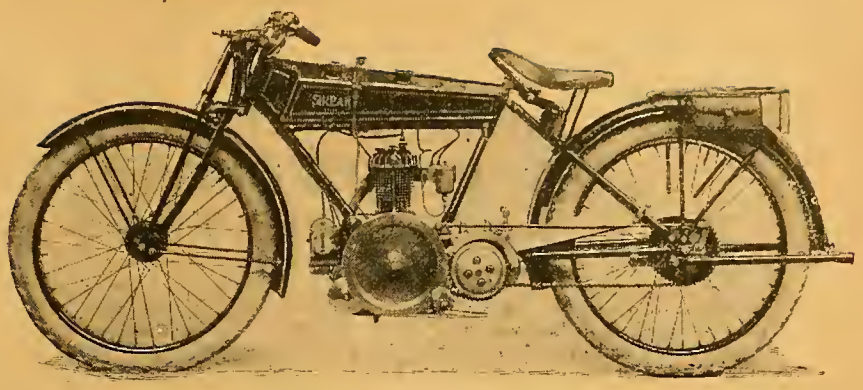


Advance Details of 1923 Models.—

which has a bore and stroke of 60×88 mm.; this unit differs from the former Blackburne patterns in that the cylinder is now a one-piece casting, the head being very well ribbed, especially in the neighbourhood of the exhaust port. With transmission by chain and belt with the latest type Burman two-speed gear box with clutch and kick-starter, complete with direct acting rear brake, disc wheels and Brampton fork, this model will sell at £51 9s. 24×2¼in. tyres are fitted, and the saddle position is extremely low.

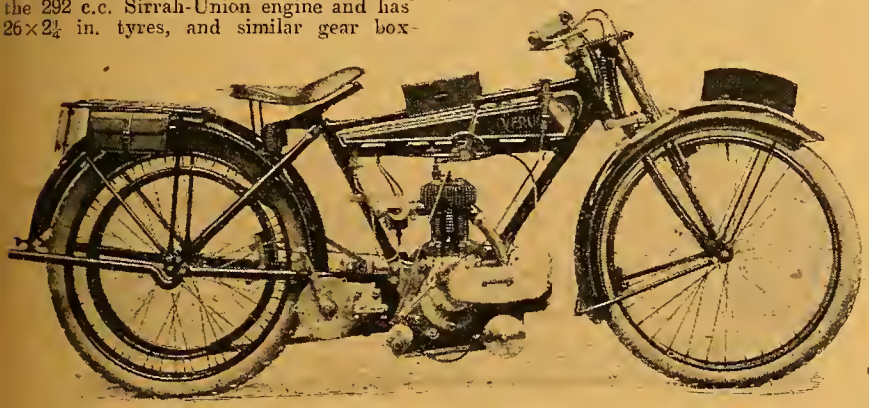
A two-stroke lightweight with 211 c.c. three-port engine will be listed as before, and may be obtained with either single gear or two-speed Burman gear box with chain and belt drive—clutch and kick-starter are retained. In other details this machine resembles the Blackburne-engined model just described.

Another two-stroke model is fitted with the 292 c.c. Sirrah-Union engine and has 26×2¼ in. tyres, and similar gear box-



Seven inches ground clearance and 28 × 3 in. tyres make this 349 c.c. Sirrah particularly suitable for the overseas market.

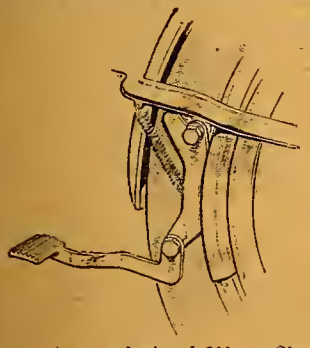
suitable for overseas conditions, and the details are well thought out. 28×3 in. tyres on heavy rims should provide a satisfactory foundation, and these wheels are covered by wide flat-sectioned guards having no valances, but ample clearance for the tyres; the minimum ground clearance is 7 in. A Burman three-speed gear with clutch and kick-starter and all-chain drive are fitted. The chains are protected by cast aluminium guards, but are readily accessible in case attention is needed. Internal expanding brakes are fitted front and rear; a saddle tank provides a neat appearance, and the machine is geared low so as to be capable of heavy plugging.



A symmetrical little solo machine is the 349 c.c. Verus-Blackburne.

Of the Verus models, perhaps the 349 c.c. side-by-side valve Blackburne-engined solo machine is the best example: it may be obtained with either two-speed, clutch and kick-starter and chain and belt drive, or three-speed all-chain drive. In either case both wheels have internal expanding brakes and very wide mudguards are used; the Brampton forks pass through these guards, the holes

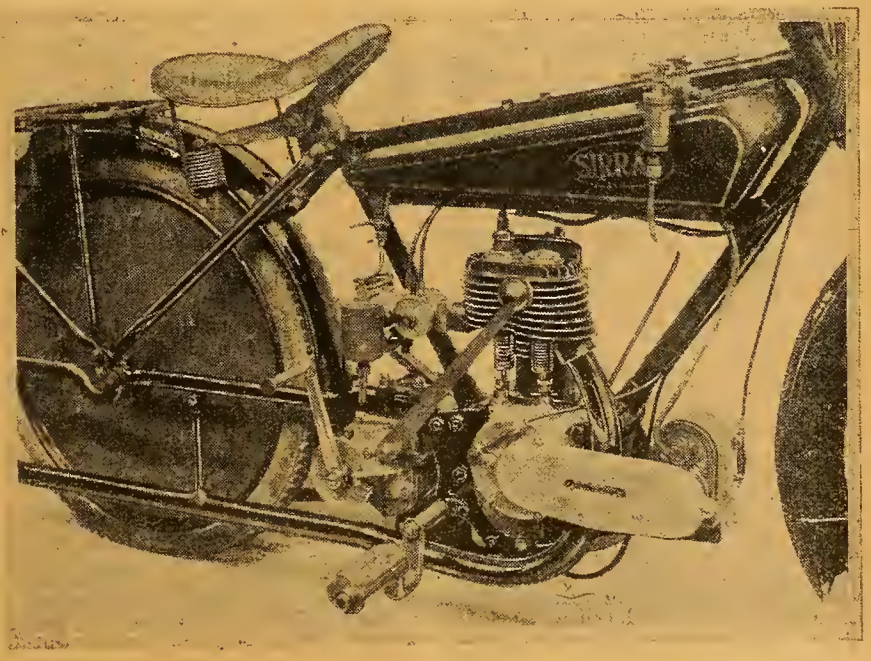
and transmission. Again, this model may be fitted with a three-speed gear and all-chain drive with clutch and kick-starter for passenger work, in which case a light Canoelet sidecar is attached. This model has already distinguished itself in long distance trials on several occasions,



Direct-acting rear brake of 211 c.c. Sirrah.

and is a very practical form of light sidecar outfit capable of taking its rider and passenger over any reasonable country.

Of considerable interest to overseas riders is the 350 c.c. Blackburne-engined model specially designed for solo work in heavy country. Great care has been taken to render this machine thoroughly



New 249 c.c. side-by-side valve Blackburne engine and the latest type Burman two-speed gear are neatly housed in the frame of a very moderately priced Sirrah model.

Advance Details of 1923 Models.—through which they pass being closed by aluminium packing pieces in a particularly neat manner. In addition to the front guards, the magneto is protected by a cast aluminium shield, and a tool box is fitted above the tank on the top tube. This type of machine can also be supplied with a Canoelet sidecar.

In addition to the models already mentioned, "super-sports" machines can be obtained in both Verus and Sirrah ranges; these should make a strong appeal to the solo rider, as they are specially designed to enable the fitting of either J.A.P. or Blackburne engines, in either the overhead or side-by-side valve types of 250 c.c. or 350 c.c.

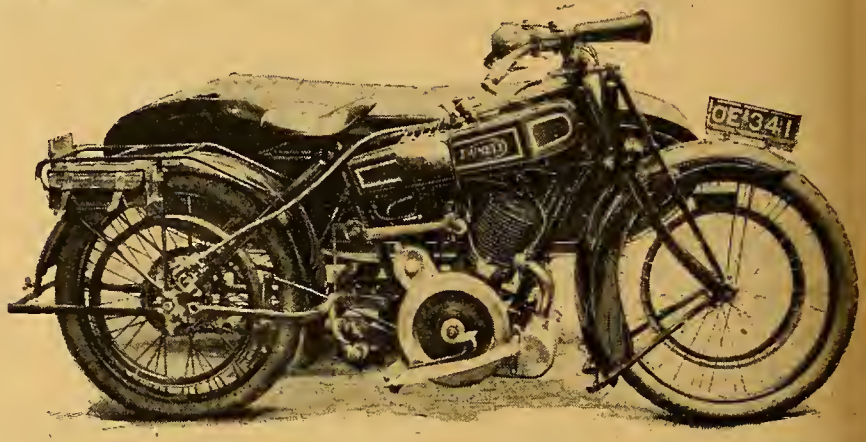
A CHAIN-DRIVEN DUNELT.

Low Priced Big Single Two-Stroke Sidecar Outfits.

MODIFICATIONS of some importance have been made in the latest model two-stroke Dunelt. The principle of the 500 c.c. single-cylinder engine is already well-known and proved; it will be remembered that a double diameter piston is employed, so that an increased charge may be drawn into the engine.

The chief alteration in the new model lies in the fact that all-chain drive is employed, and the wheelbase has been shortened by two inches. In addition to this a great deal of attention has been given to the question of silencing, and a very large cast aluminium chamber is fitted below and in front of the engine. From this chamber a tail pipe extends rearwards past the back spindle, and lying directly over the chain forms a guard therefor

Further modifications consist of more comfortable handle-bars and improved front and rear brakes. The engine itself has undergone slight modifications, the chief of which are that wider rollers are now employed in the big end bearing, while a special type of Amac carburetter has been found to increase the power output and improve the petrol consumption considerably.



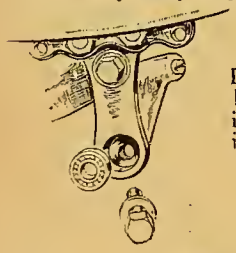
Chain-drive, a shorter wheelbase and silencer improvements are changes in the Dunelt for 1923.

The latest prices are of some interest. Solo models can be obtained with final belt drive at £75, or chain and belt £80. Sidecar models are as follows: all-chain drive £100; with interchangeable front and sidecar wheels, £112; chain and belt model, £95; and chain and belt with interchangeable wheels, £108.

SADDLE IMPROVEMENTS.

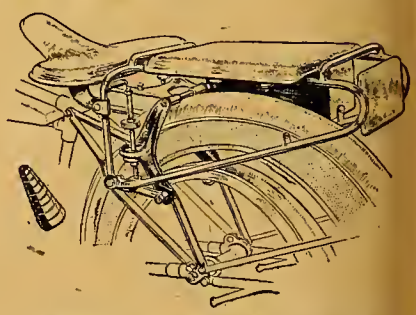
Ball-bearing X.L.-All Saddle and Combined Saddle, Carrier, and Pillion.

AMONGST the very complete range of X.L.-All saddles made by John Leckie & Co., Ltd., of Walsall, is a combined saddle, carrier, and pillion seat. A pair of stays is built into the frame over the existing rear top stays. A curiously shaped pressing forms the centre part of each stay; these pressings form the seats for a pair of involute springs, and also provide anchorage for parallel links controlling the motion of saddle and pillion. The springs may be adjusted to suit the load, and a rubber buffer is provided to prevent the pillion seat from bumping the mudguard. This device is very stoutly constructed, and the fact that both driver and passenger move in unison makes for greater safety and ease of control.



Details of the ball bearings which are inserted in all the joints of the new X.L.-All saddle.

Another innovation is a saddle which, while the suspension follows the well known X.L.-All practice, differs from previous designs in that the joints are provided with ball bearings, giving an action of extreme smoothness in exchange for a slightly increased expenditure.



Combined X.L.-All saddle, carrier, and pillion seat. One pannier bag and spring have been removed to show the construction.

FOUR-STROKE ALLON NEXT YEAR.

THE chief change to be made by Alldays and Onions (makers of the Allon lightweight) for 1923 will be the addition of a four-stroke sports model with a 346 c.c. J.A.P. engine. This machine will be fitted with two-speed Burman or three-speed Sturmey-Archer gear box. In either case clutch and kick-starter will be fitted. A choice is given also of chain and belt or all-chain drive.

The lines of the well-known Allon two-stroke are retained with certain modifications, and improvements have been made in the frame construction, notably in the fact that a special lug on the front down tube replaces engine plates, while the rear engine plates also carry the footrest hangers.

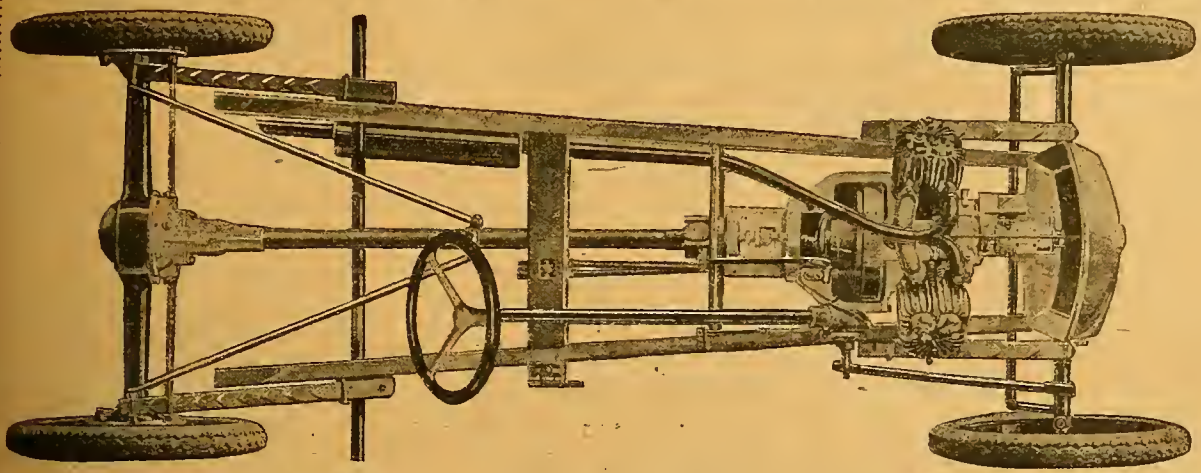
Brampton forks, 26 × 2¼in. tyres, and an E.I.C. magneto complete the specification. It will be recollected that excellent mudguards are fitted to all Allon machines.

The two-stroke, with its 292 c.c. engine and 70 × 76 mm. bore and stroke, will of course be retained, the most noticeable difference to the machine being the absence of the saddle tank.

A new silencer has been devised, consisting of a cast aluminium box bolted direct to the rear chain stays.

The frame improvements mentioned in the four-stroke type are also included in the case of the two-stroke, and in addition the exhaust pipe has been brought across to the near side so as to simplify the brake gear.

Ignition, as before, will be by means of the Villiers flywheel magneto, which has proved exceedingly satisfactory in service, and from which current for lighting may also be obtained.



The indestructible G.N

BEAUTIFUL BODYWORK ON A PERFECT CHASSIS

Representative of the finest automobile practice available, the 1923 G.N. has been built to a standard of quality—and not to a price.

Considerable reduction in cost might have been achieved by the use of plain bearings instead of ball bearings, and ordinary steels in place of such high-grade steels as B.N.D., KE805, and Cobalt-chrome—steels normally used on racing cars and very expensive cars; and sliding gears in place of the G.N. dog-clutch system. Instead, by the use of selected materials throughout, a degree of sturdiness, dependability and long life has been aimed at altogether beyond the general light car standard, while for refinement of design, detail work and finish, the G.N. has no rival at anywhere near its price.

The 1923 G.N. chassis with its powerful yet *silent* engine, *silent* B.N.D. spiral bevels, indestructible always-in-mesh gears, sweet running and fine springing, is a truly wonderful proposition; it is completed by a very roomy body of handsome design, comfortable, and in every detail beautifully finished.

THE FOUR-CYLINDER G.N

The four-cylinder model has a *monobloc* water-cooled engine with overhead valves; it is a fast and lively car of high road performance. Detail work throughout the engine is of a very high standard: all the bearings, including even the camshaft, have forced lubrication. The valve rockers and push rods are totally enclosed, the dynamo is gear-driven and a self-starter can be fitted if desired.

The chassis specification in other respects is similar to that of the air-cooled twin.

WHAT THE PRESS SAY
about the famous 26 Guineas 1¾ h.p. Lightweight
McKENZIE

No. 3.—Mr. FITZWATER WRAY. ("KUKLOS")

"I PUT a small schoolboy and a large policeman in turn on the McKenzie, pushed them off with a dozen words of advice, and they were motor-cyclists at once and for the first time. The L.P. was so pleased that the machine has since been in some danger of disappearing.

EASY CONTROL.

Knowing, through my letter bag, the class of people most interested in elementary machines of this kind, I was chiefly concerned to discover its ability, first to run slowly, and second to climb. It can be ridden just as slowly as you like in traffic, for when the pace becomes too slow to keep the engine running, you merely use the exhaust lifter and pedal at your own speed until the moment comes to restore the compression. The engine and carburetter are evidently on good terms, for even at very low speed there is less tendency to four stroke than I have found with other two-strokes. In two words, the control is ridiculously easy. Those who know the Great North Road in Hertfordshire can accurately gauge the little machine's climbing power by its performance of carrying myself 10½ stone up the two mile rise from Welwyn to Ayot Green known as the north side of Digswell Hill (Gall-and Inglis, S.E. Route 65), without any pedal assistance. I expected to be pedalling on the steep bit out of Welwyn village, but the machine climbed it unaided with a little in hand."

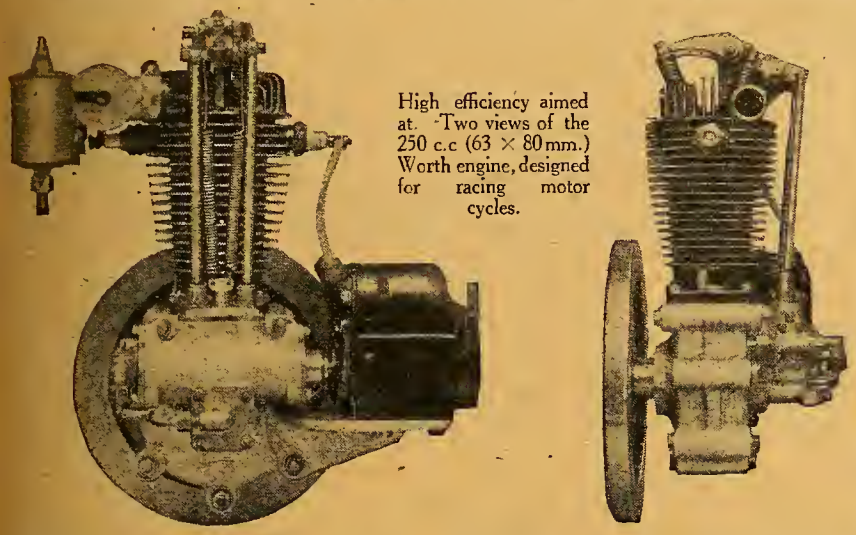
SEARCHING FOR EFFICIENCY.

A 250 c.c. Four-Valve Engine Designed for a High-Power Output.

TO attain the maximum output for a given capacity and to maintain that output for prolonged periods was the object constantly before the designer of the power unit about to be described.

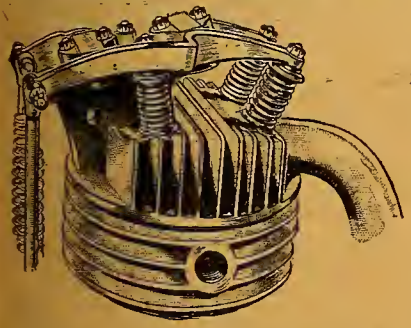
With such an aim naturally cost must be of secondary importance, and an engine designed to the same end must not, of necessity, be in the "produced for the multitude" class; therefore the subject of this article will appeal chiefly to speedmen and those interested in the latest progress of air-cooled engine construction.



High efficiency aimed at. Two views of the 250 c.c (63 × 80 mm.) Worth engine, designed for racing motor cycles.

Four Overhead Valves.

Made by the Keighley Commercial Lorry and Engineering Co. Ltd., South Street, Keighley, to the design of Mr. F. Umpleby, the Worth engine, as it is named, is a single cylinder of 63 × 80 mm. bore and stroke (250 c.c.), having four overhead valves operated by push rods and rockers worked from a transverse camshaft driven by skew gearing.



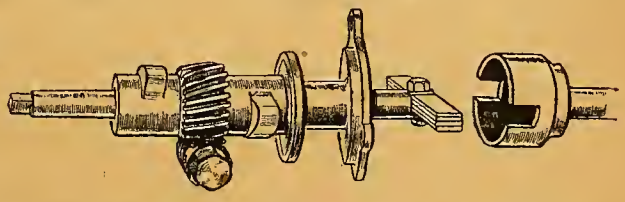
One-piece cylinder with overhead rocker bearing supports cast integrally with the head.

Cast iron is used for the cylinder, which is in one piece; the support for the overhead rocker bearings being integral with the head. Deep radiating fins are a feature, those on the head being placed in the direction of travel. The inlet port faces to the rear and the exhaust out to the left or flywheel side, the exhaust pipe having a flange fixing.

There are two inlet and two exhaust valves arranged in the head, which is of the pent-house variety, the valves being slightly inclined. The valve spring collars are screwed on to the stems and retained by split pins passing through castellations.

Turning to the crank case: the shaft is machined from a solid forging and is carried on two roller bearings on the flywheel side (the outside flywheel is also of steel) and a self-aligning ball bearing on the timing side, the latter taking thrust from the camshaft skew gear. A tubular connecting rod, with split big-end bearing links up the slightly domed aluminium piston. Two rings in one groove and a floating gudgeon pin are carried by the latter.

Worm driven camshaft. At the rear-end is the square for driving the pump, at the other the laminated spring coupling for the magneto.



Worm Driven Camshaft.

Valve operation, as mentioned above, depends upon the agency of a transverse camshaft driven by skew gearing. This shaft is carried in long plain bearings in a cylindrical housing on the side of the crank case. In the centre of the shaft is the pinion, located on each side of which are the cams.

At its rearmost end the camshaft is squared to provide a drive for the small gear pump which is mounted on the end cap of the camshaft housing, while the forward end of the shaft carries a small pack of leaf springs in a fork; these springs engage with notches in a small bell or cup fixed on the magneto spindle, the magneto being mounted on a bracket beside the crank case.

Motion from the cams to the valve rockers is transmitted by large diameter roller-ended tappets working in bronze guides. The hollow tappet rods are secured to the rockers by yoke-ends and bolts, and the rockers are returned by independent tension springs, the valve springs being called upon to close the valves only. The forked rockers are a particularly fine piece of work, machined out of the solid, with their spindles, which rock in bearings formed in the cylinder head extension; they are retained by bronze caps, which complete the split rocker bearing.

Rocker Clearance Adjustment.

Adjustment for clearances in the rocker mechanism is provided by rather minute nuts and set screws in the rocker tips, bearing directly on the valves. This is the only point we should be inclined to criticise in an otherwise excellent design.

Lubrication is effected by pumping the oil to the timing side of the crankshaft, then *via* drilled oilways to the big-end, surplus being flung up to the piston and cylinder walls. The timing gear is connected to the crank chamber by a large breather, which ensures an ample supply of oil reaching the former. Grease cups are provided for the rocker bearings.

The Worth engine was entered by G. Williams in last Saturday's Brooklands championship meeting.

1923 OMEGA MODELS.

APART from the introduction of the new model described last week the Omega range will be considerably reduced in price. The most important modification lies in the fitting of an expanding rear brake to the all-chain driven models. Prices are given below:—

348 c.c two-stroke single gear with variable ignition and two rear brakes, £37; with two-speed, chain and belt, £43.

348 c.c. two-stroke, two-speed, clutch and kick-starter, all-chain drive, with expanding rear brake and dummy belt rim brake in front, £51; three-speed, £55; with sidecar, £72.

292 c.c. J.A.P. engine, two-speed, clutch, kick-starter, all-chain, £62; chain and belt, £55; three-speed all-chain, £65.

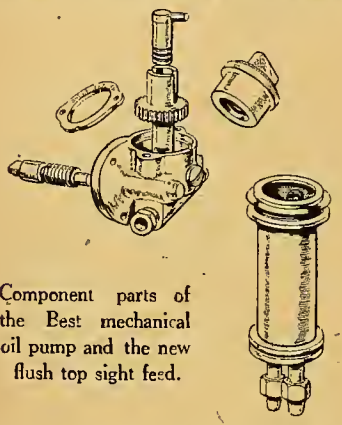
The well-known duplex frame model with two-stroke engine and two-speed all-chain drive, clutch, kick-starter, £65; and three-speed, £69.

THREE PROPRIETARY MECHANICAL LUBRICATORS.

New Departure in Best Pump Design. Lamplugh Vane Pump and Showell Rotary Principle Retained.

THE Best mechanical oil pump in its present form has already earned a name for reliability and accuracy; but the makers, Best and Lloyd, Ltd., Handsworth, Birmingham, are producing an entirely new model which will be exhibited at the forthcoming Olympia Show.

Simplicity is the outstanding detail of this pump. A central sleeve has rotary movement imparted to it by a worm driven off the half-time shaft of the engine, a gear reduction of 35 to 1 being obtained. Inside the sleeve is a plunger on which is formed a lug; the sleeve is



Component parts of the Best mechanical oil pump and the new flush top sight feed.

slotted at the top to receive the lug and give rotary motion to the plunger. Over the sleeve and plunger fits a cap, inside which a cam groove is cut. The lug on the plunger moves in this groove, and by it is made to reciprocate in the sleeve. At the bottom of the sleeve is a port which registers with the supply port on the upward stroke of the plunger and with the delivery port on the downward stroke.

The flow of oil is regulated by turning the cap in which the cam groove is cut; this alters the position of the plunger in the sleeve in relation to the opening and closing of the ports. Thus the supply of oil may be cut off entirely or the maximum flow may be maintained. When once the correct flow has been ascertained, the cap is secured in position by a locking device.

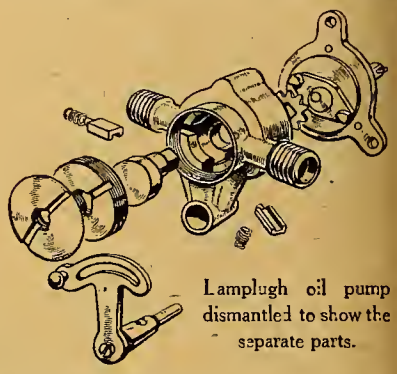
For use in conjunction with this pump is a sight indicator, made to fit flush with the top of the tank. This is for those riders who desire to see that the pump is doing its work, but we are informed that so reliable is the pump that an indicator is really unnecessary.

Lamplugh Pump Improvements.

Since the Lamplugh mechanical pump (S. A. Lamplugh, Ltd., Tyseley, Birmingham) was last described in our pages detail improvements have been effected which have resulted in increased efficiency. The construction of the pump is distinctly unusual, and the action is most interesting. An eccentric member revolving in the pump body is driven from the half-time shaft by a positive trip gear engaging a star gear wheel by an oscillating motion; this provides a reduction of 10 to 1. Bearing on the periphery of the eccentric are two spring loaded rectangular plungers in which oil grooves are cut; these plungers are set 90° apart, and one communicates with the oil inlet and the other with the outlet to the regulating valve.

Oil is sucked between the eccentric and the pump casing, and is carried round by the eccentric motion of the former until it reaches the delivery plunger when it escapes through the oil groove to the regulating valve, and so to the engine (or back to the inlet as determined by the setting of the regulator which controls a by-pass). The pump is positive in action and does not rely on gravity to obtain its supply of oil, but will, we are informed, without priming, lift oil from a tank approximately 3 ft. below its own level and deliver it to the same height above.

We have been enabled to examine the pump performing this operation, and we were informed that it had been running



Lamplugh oil pump dismantled to show the separate parts.

for more than six months, day in and day out, at a speed of 4,500 r.p.m.; this, it is calculated, is equivalent to a road distance of 47,000 miles, and even after this strenuous test there was no apparent wear—a remarkable performance for a device which is less than 1¼ in. in diameter.

Unchanged Showell Pump.

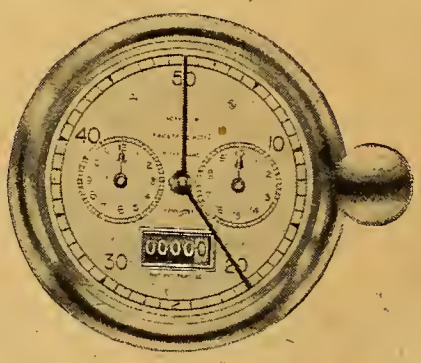
So satisfactory have been the results obtained with the Showell rotary pump that the makers have decided that no change in design is necessary.

For those who wish to fit this pump to existing machines at present equipped with semi-automatic drip feeds, a special bracket to carry the sight feed is provided. This bracket takes the place of the hand pump, and no alteration to the tank is necessary to enable it to be fitted. The price of the pump alone is 16s. 6d. The pump and sight chamber for attachment to existing hand pumps costs 25s. 6d., while the pump, sight chamber, and hand pump is priced at 37s. 6d. The makers are E. Showell and Sons, Ltd., 14, New Street, Birmingham.

MEASURING RUNNING TIME AND SPEED.

ALREADY too well known to require description, the Bonniksen speedometer has undergone yet a further refinement in that it can now be obtained to register running time as well as distance and speed.

It will be remembered that the Bonniksen mechanism is governed by a watch escapement, and by the addition of a train of gear wheels it can be converted into the equivalent of a watch so long as the machine is in motion. This principle has been employed in the manufacture of the latest instrument, on the main face of which are two small dials, each equipped with a couple of hands in a similar fashion to a watch. The right-hand of these two small dials is a normal trip recorder, and it is divided into ten divisions, the long hand covering one division for each mile run, and the



The latest type of Bonniksen speedometer, which registers running time as well as mileage.

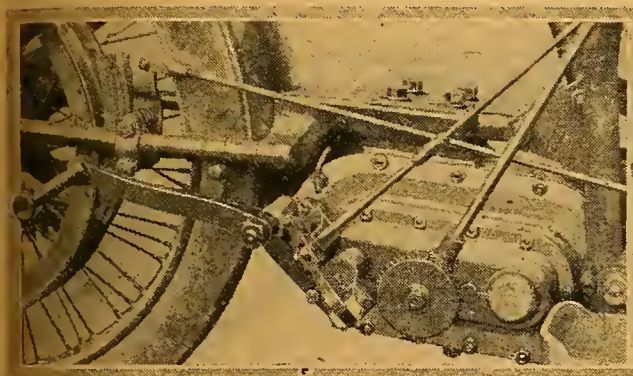
small hand one division for each ten miles. The dial on the left hand is a clock dial pure and simple, and when the machine is in motion it registers time in exactly the same manner as a watch. Both time and trip hands can be set back to zero at any time.

The instrument will be of special interest to competition riders, since the average running speed can be instantly and simply calculated from the readings of the two dials. It should be added that the combined time and speed meter is no larger than the standard Bonniksen speedometer.

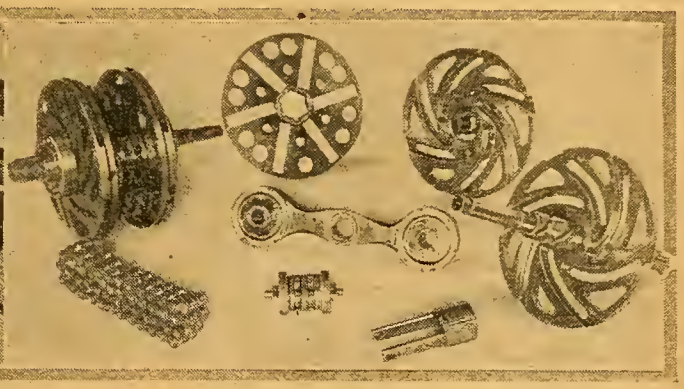
As before, the manufacturers are Rotherham & Sons, Ltd., Coventry, and the cycle type is sold complete with front wheel driving mechanism for £6 10s., or the American type of rear drive 10s. extra.

INFINITELY VARIABLE CHAIN-DRIVE GEAR.

Progressive Change of Ratio by Enclosed Expanding Sprockets. Pitch Variation Difficulties Surmounted.



(Left) External view of the British Universal gear box, showing control mechanism.



(Right) Component parts of the gear and the two chains connecting the two shafts.

DESPITE the comparative inflexibility of internal combustion engines, motor cycles were used for many years with a single gear ratio in the transmission.

Then came the adjustable pulley which developed into the infinitely variable gear, still remembered by many as an "ideal" gear under ideal conditions. But wet weather, hill climbing, and passenger work demanded something more positive, and gears proper, with two definite speeds, came into being. Then followed the intermediate gear between top and bottom ratios, and to-day the three-speed is almost universal and showing a strong tendency towards merging into a four-speed arrangement.

Lack of positive drive under adverse conditions killed the infinitely variable belt transmission, but the desire for the charm of a progressive range of ratios between high and low limits has remained, and from time to time such devices embodying gears or chains have been evolved on paper with little or no success.

Difficulties with Positive Drives.

Naturally, a driving chain with its constant pitch will not accomodate itself to the teeth of a sprocket expanded radially, since the pitch of the latter increase as the sprocket diameter increases. At last, however, a chain gear box, named the British Universal, has been evolved which gives a progressive range of gearing between limits equivalent to 4 to 1 and 16 to 1 on a standard motor cycle.

Primarily the gear consists of two shafts on which are mounted expanding sprockets; one shaft is driven by the engine, and from the other the drive is taken to the back wheel. A chain connects the expanding sprockets, which are made up of six segments each carrying three teeth; in the unexpanded state, therefore, each sprocket has 18 teeth.

The toothed segments are carried by blocks engaged in guide slots formed in one of two side plates keyed on the shaft. Rollers mounted on the blocks engage with cam slots formed in the other side plate, and when motion is applied to a bar connected to sleeves capable of moving these side plates relative to one another, the blocks are caused to move farther from or nearer to the centre.

The slots and guides are determined by plotting the path of the teeth when passing from one pitch diameter to another; consequently the engagement of the teeth with the chain is correct and the drive is quite smooth.

Automatic Pitch Adjustment.

Movement of the sleeves causing the side plates to rotate relatively to one another is effected by means of spiral grooves, and as these latter are oppositely arranged, one chain wheel is caused to expand and the other to contract. The blocks carrying the teeth are centralised by means of light springs, with the result that should the rollers engaging with the slots in the side plates not pass exactly through the required pitch positions, slight but sufficient compensation is allowed. Owing to the fact that no toothed segments can be more than half a pitch out of position, a free segment will enter into proper engagement on meeting the chain.

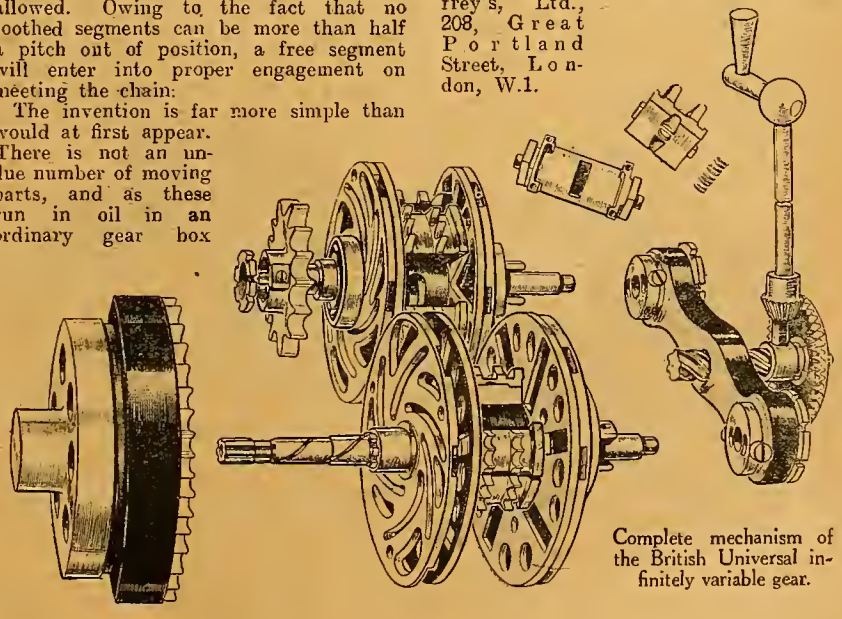
The invention is far more simple than would at first appear. There is not an undue number of moving parts, and as these run in oil in an ordinary gear box complete with kick-starter and clutch of conventional design, excessive wear and noise should be absent.

The first experimental gear box is fitted to a New Imperial sidecar outfit, and is certainly somewhat large, but a new design is being built for Scott machines which is notably smaller and neater in appearance.

In action the gear is worked and behaves in just the same manner as an expanding pulley gear, the clutch being quite independent. Actually, the experimental gear has been in use for about eleven months and has run for approximately 3,000 miles.

The gear is not at present on the market, but it is hoped that it will be some time next year.

The British Universal Variable Gears, Ltd., hold all rights except those affecting motor cycles, which latter are in the hands of Mr. C. F. M. Marks, c/o Godfrey's, Ltd., 208, Great Portland Street, London, W.1.



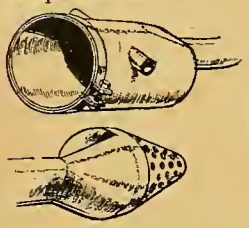
Complete mechanism of the British Universal infinitely variable gear.

SPORTING SOLO NEW HUDSONS.

New 350 c.c. and 500 c.c. of Neat Appearance and Clean Design.

FOR next year the 595 c.c. New Hudson sidecar outfit will be retained, with minor improvements which have been brought about as a result of the firm's experience throughout the year. The price will be still further reduced to the neighbourhood of £118 10s.

Except for certain refinements, the 87 × 100 mm. engine remains unaltered, but a new type of silencer with a simple but efficient baffle and flat tail pipe, and cast aluminium chain guards, will now be fitted. A Terry saddle is now an item of the specification.



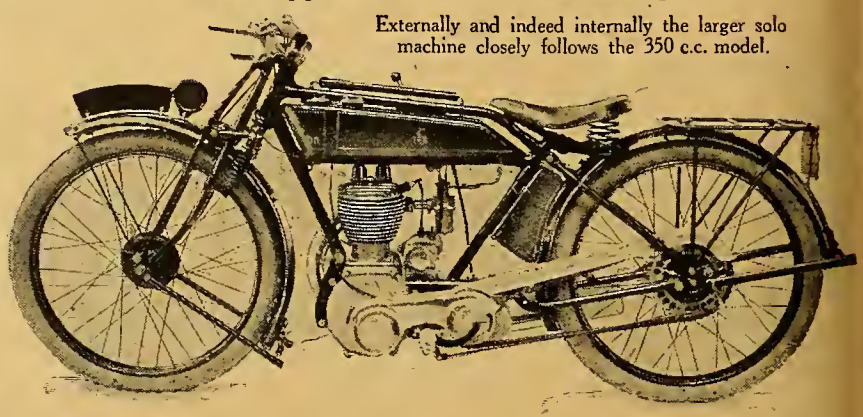
A novel silencer fitted to the 595 c.c. New Hudson.

It will be remembered that salient features of this model, with which we dealt recently after a road trial, include good footboards and legshields, excellent mudguarding (now even further improved), a change-speed lever which passes through the tank in a particularly convenient position; all-chain drive with internal expanding brakes on both front and rear wheels, and a serviceable decompressor.

A further improvement lies in the Druid-pattern forks, which are now provided with an adjustment for taking up side play.

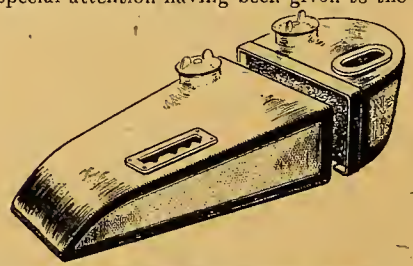
The standard sidecar has a well-built and roomy body with deep upholstery and a big locker. A family sidecar with child's seat in front of the passenger's seat can be obtained for an additional £12, and the outfit, complete with a *de luxe* body having hood, scuttle dash, screen, and side curtains, is priced at £135. All prices are provisional, and subject to slight modification.

In addition, a sports outfit, having a similar specification but plain D section mudguards, and footrests instead of footboards and legshields, complete with a smart aluminium sidecar, is listed at £125.



Externally and indeed internally the larger solo machine closely follows the 350 c.c. model.

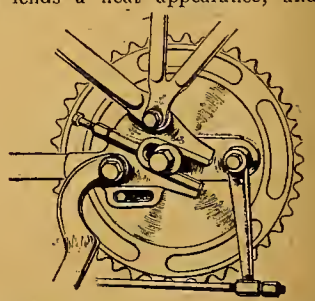
Perhaps the most interesting addition to the New Hudson range is a light solo machine which is equipped with an engine of 70 × 90 mm. (346 c.c.), side by side valves, and plain bearings throughout, special attention having been given to the lubrication of the bushes. A single cam operates both valves through specially designed rockers, and the valves are retained on their seats by double concentric springs.



Petrol and oil tanks are completely separate.

Very deep circumferential cooling ribs with cooling towers in the valve caps and an internal exhaust lifter are features of the design. Chain transmission throughout and a new gear box of New Hudson design are employed. The chief features of the box are that ball bearings are used exclusively, and that the kick-starter operates direct through a lay shaft gear. The standard ratios provided are 5.6 to 1, 9 to 1, and 13 to 1. A dry plate clutch having bonded asbestos inserts provides the frictional connection. Both chains are protected by cast aluminium guards, and to absorb transmission shocks a Renouf type shock absorber is fitted to the engine shaft.

A further feature of some importance lies in the tank construction, the fuel and oil tank being composed of two separate units fitted together with a thick felt pad between. A short over-lap of the oil tank lends a neat appearance, and the advantages in the case of tank leakage are obvious.

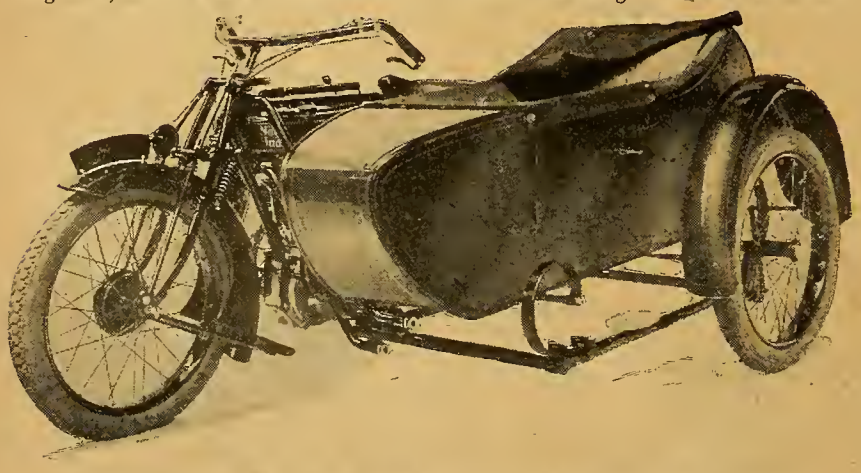


By inclining the grooves for the rear spindle and brake stop at certain angles the necessity for brake adjustment when tightening the rear chain is avoided.

The machine is priced at £70, or a similar machine turned out as a sports model without kick-starter, footboards, or legshields, at £75.

A larger edition similar in almost every detail employs a similar (79.5 × 100 mm.) engine to that used in the last Tourist Trophy races. The machine has 26 × 2⅜ in. tyres, slightly wider guards, and more powerful brakes. Its price is £85.

The three-wheeled light car, which stands at the very top of its class, has undergone no modifications except in price; the sum of £195 now covers the complete vehicle with detachable wheels, spare wheel, electric lighting, etc.



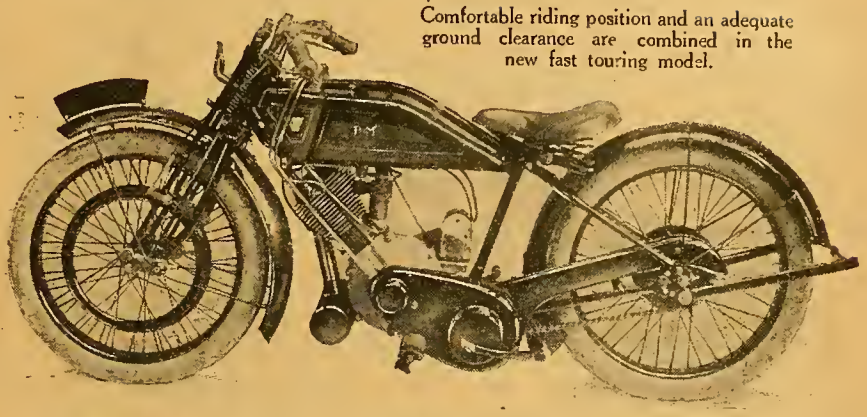
Latest model of the 595 c.c. New Hudson fitted with the standard pattern sidecar.

SPORTING P. & M. FOR 1923.

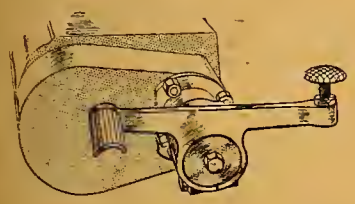
Comfort and High Road Performance aimed at on New Model.

ONE of the oldest makes in Great Britain, the P. and M. has enjoyed a reputation second to none for high-class workmanship and finish as well as reliability. During the last year or two its speed has been increased surprisingly, and now a new sports model has been introduced which will satisfy the keenest enthusiast.

Unlike many sports models, it is not a standard machine fitted with a special engine and with various parts cut down for the sake of lightness, but is specially built as a fast touring mount, pre-eminently comfortable, with a low saddle position (28in. from the ground) and wide flat handle-bars designed to give perfect control without stretching or straining any part of the body.



Comfortable riding position and an adequate ground clearance are combined in the new fast touring model.



Foot control is employed only for the selector clutch portion of the gear.

Owing to the fact that an entirely new frame has been constructed, with the top tube curved in a sweep towards the rear so that the riding position may be as low as possible, both engine and gear box are brought down 3in. without affecting the ground clearance.

Reduction of weight has been effected by eliminating such luxury fittings as the kick-starter and carrier (which, of course, may be had as extras), but the mudguards are wide and efficient. Points about the frame are the elimination of clips, the place of which is taken by lugs, a head bearing of large size, the fixing of the handle-bar not only by means of the ordinary clamp but by an expanding handle-bar stem.

There has been little alteration to the 555 c.c. engine, but a die-cast aluminium piston has now been fitted, while the compression has been raised from 55 lb. to 60 lb. The engine is certainly efficient; free passages are allowed for the mixture and the exhaust gases. The latter pass through a short wide-diameter pipe into a large expansion chamber placed forward of the crank case, while a long exit pipe is provided for their final release.

A single aluminium cover is employed for the protection of the valve stems, and an external exhaust lifter has been fitted.

Two gallons of fuel is the capacity of the tank, which also holds 3¼ pints of oil, while underneath it is fitted a spacious tool bag.

New Gear Control.

Little alteration has been made in the transmission, but a slight change has been brought about in the change speed mechanism, as in the "Panther," as the new machine is called, the dog clutches are actuated by means of a single gear lever of conventional design, while the expanding gears taking the place of clutches are worked by a rocking pedal. Both chain guards are in one piece and are secured by two bolts only.

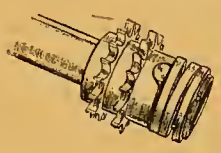
The spring of the transmission shock absorber is now adjustable, an important point, as with a high top gear correct adjustment is necessary to ensure a smooth drive. Gears between 3½ and 11 to 1 are obtainable, but when a sidecar is fitted (sidecar lugs are provided in the frame) the top gear is 4½ to 1.

All the well-known and much appreciated P. and M. features have been retained, such as Best and Lloyd mechanical lubrication through sight feed. The workmanship and material throughout is superb. The rear brake is of the contracting type, actuated by the rider's left heel, and easily accessible from the foot-rest, while the front is of the dummy belt rim pattern, controlled from the handle-bar.

Weight and Price.

The weight is 256 lb. and the price £100.

The chief attraction of the machine is not only its extreme comfort, but the charm provided by the four speeds, which allow the joys of the high top ratio to be appreciated to the full.

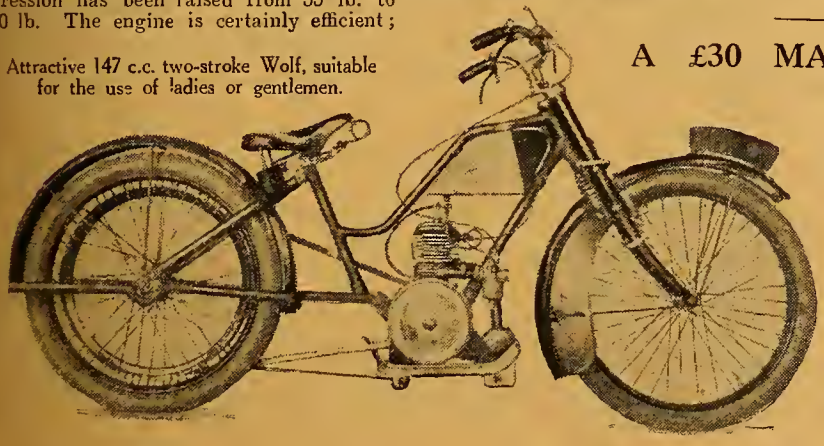


Improved adjustment of the shock absorber is provided.

Standard P. and M. models remain practically unaltered for 1923.

Phelon and Moore, Ltd., Berners Street, London, W.1, are the manufacturers.

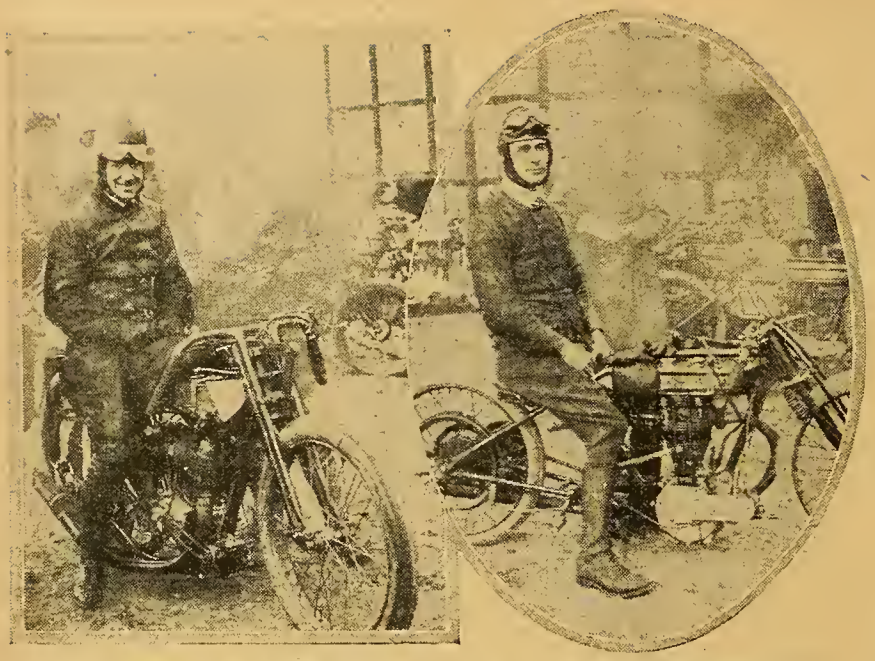
A £30 MACHINE TO SUIT ALL.



Attractive 147 c.c. two-stroke Wolf, suitable for the use of ladies or gentlemen.

TO suit riders of either sex, the Wolfruna Engineering Co., Ltd., Great Brick-kiln Street, Wolverhampton, will introduce a new semi-open framed Wolf model equipped with a 147 c.c. Villiers engine with flywheel magneto. With single gear belt drive the price will be £30, and for an extra £5 a two-speed gear box can be fitted. The saddle position is low and tyres of ample size for such a small machine are included in the specification. Aluminium footboards are used, and the heel-operated belt rim brake pedal is mounted on the near side; the front brake is of the rim variety, controlled by the usual handle-bar lever.

CHAMPIO
AT B



Four championships were won by H. Le Vack—two on the 998 c.c. Zenith-Jap and two on his o.h.v. lightweights.

500 c c solo and 600 c c. sidecar championships were won by V. Horsman (o.h.v. 490 Norton) as well as the all-comers handicap.

ALTHOUGH last Saturday's Championships meeting at Brooklands was probably the most successful of the year, it is not easy to say exactly why. Perhaps it was because the racing was of a uniformly good, if not excellent, standard throughout.

It was not, to use horse-racing parlance, entirely a backer's day; for instance, neither of those popular favourites with the crowd, C. G. Pullin and J. Emerson, succeeded in winning a race, although a championship or two would certainly have been a fitting conclusion to their previous accomplishments and their energetic specialisation in track work during the year. Both of them experienced bad luck.

Four Championships for Le Vack.

H. Le Vack, on the other hand, was in great form and gained four of the chief honours—two with the 998 c.c. Zenith-Jap and two with the smaller o.h.v. New Imperial-Japs—in each case without apparently having to exert himself fully. Even the American twins had to be content with places in the 1,000 c.c. event.

The 600 c.c. sidecar and 500 c.c. solo classes fell comparatively easily to V. Horsman's o.h.v. Norton, and the remaining two—350 c.c sidecar and 750 c.c. solo—provided the only two genuinely surprise winners, in W. D. Marchant (349 O.K.-Blackburne sc.) and F. T. Hatton (746 Douglas).

Easily the largest crowd of this year witnessed the racing, and although there were no thrilling neck-and-neck finishes, there were many exciting incidents to reward the cold vigil of the spectators. Incidentally the weather was very cold indeed, but fortunately dry.

Three handicaps of three laps each concluded the meeting, but the five laps from scratch championships deserve premier mention.

350 c.c. SIDECAR CHAMPIONSHIP.
1. **W. D. Marchant (349 O.K.-Blackburne sc.).**
2. H. Le Vack (346 J.A.P. sc.).
3. V. Baxter (346 Holroyd sc.).
Winner's speed=62.27 m.p.h.

Five started, including C. F. Temple on a Coventry-Eagle. Marchant made an inartistic get-away and was very nearly left at the post, but the way in which he gamely went on to overhaul the field provided a most piquant appetiser to the day's excitement. In winning he broke the five-mile record at 65.51 m.p.h. His sidecar chassis was neatly streamlined and he used a very secret induction system which appeared to be warmed by the heat of the engine.

600 c.c. SIDECAR CHAMPIONSHIP.
1. **V. Horsman (490 Norton sc.).**
2. E. Headlam (496 Zenith-Bradshaw sc.).
3. T. Simister (490 Norton sc.).
Winner's speed=64.79 m.p.h.

Anything might have happened here, but Pullin (Douglas sc.) went out first lap with a burst gear box sprocket, and Emerson's Douglas caught fire when leading on the second circuit. Thereafter Horsman forged ahead, leaving Headlam, Simister, and G. H. Tucker (588 Norton sc.) to do battle for the places. Headlam burst a tyre almost on the finishing line. But he would never have caught Horsman.

1,000 c.c. SIDECAR CHAMPIONSHIP.
1. **H. Le Vack (993 Zenith-Jap sc.).**
2. O. de Lissa (996 Motosacoche-M.A.G. sc.).
3. G. Packman (976 Packman sc.).
Winner's speed=71.31 m.p.h.

At first it seemed as if the big twin sidecars were going to provide a titanic

So many entries were received for the "all-comers"

MEETING LANDS.

struggle. First lap order was: I. P. Riddoch (998 Zenith-Blackburne sc.), G. Packman (976 Packman sc.), and Le Vack. Riddoch's clutch gave out next time round, and Le Vack had overtaken Packman. After one more short circuit the Zenith-Jap had a 300 yards lead, which it held to the finish. The speed would have been higher had Le Vack been in any danger on the final laps.

250 c.c. SOLO CHAMPIONSHIP.
1. **H. Le Vack (249 J.A.P.).**
2. J. V. Prestwich (249 J.A.P.).
3. L. F. Peaty (249 Hawker).
Winner's speed=58.94 m.p.h.

Mrs. Janson was to have ridden here, but withdrew because only her second fastest machine was available. She regretted her decision, for even thus handicapped she might easily have gained a second. The winner got so far ahead that he slowed up for a chat with his depôt after four laps; and the fourth and last man, H. L. Biggs (Sun-Vitesse), finished just as they were lining up for the next race.

350 c.c. SOLO CHAMPIONSHIP.
1. **H. Le Vack (346 J.A.P.).**
2. C. G. Pullin (346 Douglas).
3. T. Eve (346 Douglas).
Winner's speed=76.91 m.p.h.

Le Vack and Pullin were expected to make a fight of it, and for three laps certainly there was not much between them, although the former led each time.

After being delayed at the start W. D. Marchant (349 O.K.-Blackburne) won the 350 c.c. sidecar championship, breaking the 5 mile record in doing so.

Then temporary trouble delayed the Douglas man so long on his fourth lap that it was thought that he had retired. But he got going again and was so far ahead of the others that he remained an easy second. Eve, however, had quite a keen duel with E. Remington (Edmund-Blackburne) for third place.

w3 run off in two heats Lining up for heat one

F. T. Hatton (746 Douglas) won the 750 c.c. championship after a race full of incident but finishing tamely.

500 c.c. SOLO CHAMPIONSHIP.
1. **V. Horsman (490 Norton).**
2. J. Emerson (494 Douglas).
3. F. B. Halford (499 Triumph).
Winner's speed=81.53 m.p.h.

Among the thirteen starters there were at least five possible winners: Halford, on a four-valve Triumph with an experimental water-cooled cylinder head and radiator in forepart of tank, Le Vack on his 346 c.c. machine, but not to be disregarded, Pullin, Emerson and Horsman. Halford, Horsman, Emerson, and Le Vack was the first lap order; Pullin seized his gear box. Emerson moved up two places in lap two, and Horsman changed places with Halford on lap three, and took the lead in lap four. By this time Pullin had begun to move up again, and the order became Horsman, Emerson, Pullin, Halford, and Le Vack. But Pullin's lucky star was in the descendant, and Halford had crept back to third when they hurtled across the finishing line. It was a hardly-fought race.

750 c.c. SOLO CHAMPIONSHIP.
1. **F. T. Hatton (746 Douglas).**
2. V. Horsman (490 Norton).
Winner's speed=76.97 m.p.h.

By wonderful acceleration Hatton gained a useful lead at the start, but at the end of two laps Pullin, on a 746 c.c. Douglas, and Horsman still on the 490 c.c. o.h.v. Norton, were drawing dangerously near. Pullin retired next time round, and Horsman gained the lead, which he increased on the fourth lap. Then, to everyone's surprise, Hatton swept across the line an easy winner, and Horsman, delayed by a petrol stoppage, came in second—and last, for nobody else finished! The comparative speeds in this and the preceding class are illuminating.

1,000 c.c. SOLO CHAMPIONSHIP.
1. **H. Le Vack (998 Zenith-Jap).**
2. C. F. Temple (989 Harley-D.).
3. T. R. Allchin (989 Harley-D.).
Winner's speed=92.65 m.p.h.

Championship Meeting at Brooklands.—All sorts of rumours were prevalent regarding the speeds of the 1,000 c.c. machines; aided by "dope," lap speeds of 105 m.p.h were expected. Therefore the race, in a way, was somewhat disappointing. Le Vack led E. Remington (998 Blackburne), Temple and Allchin at the end of a whirlwind lap, and as they passed the paddock they all signalled frantically that someone had crashed. Later it turned out that the front tyre of George Brough's Brough-Superior had burst at 95 m.p.h., miraculously without damaging the rider. But it was a great pity, for Brough had made a magnificent start and might have proved a worthy opponent for Le Vack, who, as it was, nearly lapped the field, and broke the 10-mile standing start record at 91.54 m.p.h. The winner's machine was fitted with Harley forks and an adjustable shock damping device.

All Comers Handicap.

Three handicaps followed. The "all-comers" attracted 60 entries, and was run in two heats, the first ten in each competing again in a final. First, second and third in the heats were: T. Eve (346 Douglas), at 66.92 m.p.h.; V. Horsman (490 Norton), and F. B. Halford (499 Triumph); and R. Chaplin (496 Douglas), at 73.45 m.p.h.; G. Maund (400 A.B.C.), and R. O. Lowe (490 Norton), respectively. Horsman sent the speed up to 86.28 m.p.h. when he won the final.

Chaplin, on the same machine, won the private owners' event easily, and V. Anstice kept the Douglas flag flying in the passenger race.

PRIVATE OWNERS HANDICAP.

1. **R. Chaplin (496 Douglas).**
2. A. G. Williams (492 Sunbeam).
3. R. O. Lowe (490 Norton).

Winner's speed=72.79 m.p.h.

ALL-COMERS SOLO HANDICAP.

1. **V. Horsman (490 Norton).**
2. R. Chaplin (496 Douglas).
3. R. O. Lowe (490 Norton).

Winner's speed=86.28 m.p.h.

THE MOTOR CYCLE

SPECIAL SHOW NUMBERS.

NOVEMBER 25th to DECEMBER 2nd marks the period when the

MOTOR CYCLE EXHIBITION

at Olympia will be open to the public.

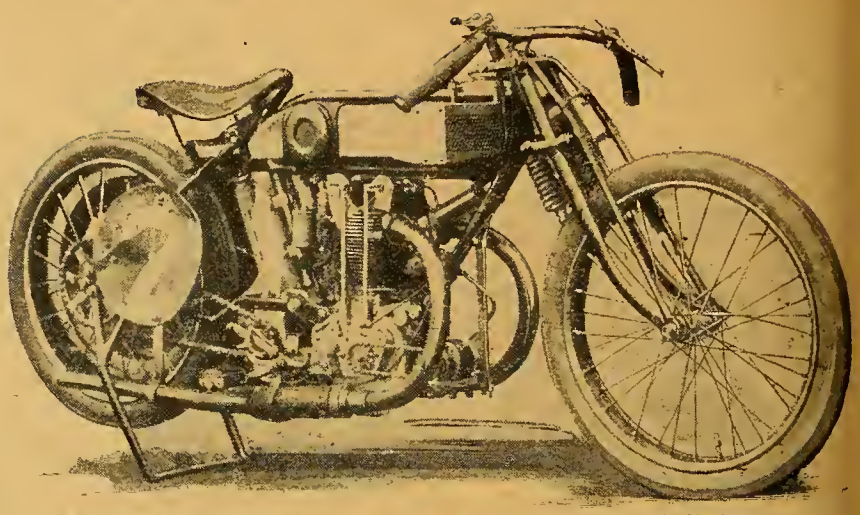
In connection with the Show "The Motor Cycle" will publish Four Special issues as under:

Nov. 9th. Lightweights and Accessories.
Nov. 16th. Passenger Machines.
Nov. 23rd. Show Forecast and Guide.
Nov. 30th. Show Report.

Each of these enlarged issues will embody special features possessing a strong appeal to all who own or who contemplate the purchase of a motor cycle.

To avoid disappointment an order should be placed in advance with the local Newsagent.

EVERY THURSDAY....THREEPENCE.



BACK TO WATER-COOLING? Purely as an experiment, F. B. Halford has had a water-cooled head fitted to his four-valve Triumph. The radiator is situated in the fore part of the tank.

ALL-COMERS PASSENGER HANDICAP.

1. **V. Anstice (733 Douglas sc.).**
2. V. Horsman (490 Norton sc.).
3. S. M. Greening (346 Francis-Barnett sc.).

Winner's speed=69.29 m.p.h.

A. Gaydor-Smith (Norton sc.) finished second, but was disqualified because his passenger did not wear a safety helmet.

In addition to Marchant's and Le Vack's records referred to above, the 500 c.c. solo and 600 c.c. sidecar flying five miles records were broken by V. Horsman (on o.h.v. 490 c.c. and 588 c.c. Nortons) as follows:

CLASS C. (500 c.c. Solo).
FIVE MILES (flying start), 3m. 22.66s.=89.25 m.p.h. (143.63 km.p.h.).

CLASS F. (600 c.c. Sidecars).
FIVE MILES (flying start), 4m. 4.72s.=73.55 m.p.h. (118.38 km.p.h.).

* * * *

Years ago it was affirmed that 70 m.p.h. was the limit speed of a motor bicycle at Brooklands, due to the nature of the track.

It was "dope day" at Brooklands on Saturday, which may or may not account for the excellent speeds attained. There was much speculation as to the nature of the mixture (which varied, of course), but its presence was often certified by the odourous nature of the exhaust!

* * * *

Congratulations to H. Le Vack upon his successes, and particularly his phenomenal speed in the 1,000 c.c. championship event. Actually, Le Vack's Zenith-Jap should be credited with a greater speed than 92 m.p.h., for he had to travel on the outer (car) line, due to the speed of his machine, which means that a car lapping the track in the same time would be credited with an extra two miles per hour.

* * * *

An excited spectator nearly got into serious trouble on Saturday by yelling "Beaver" at the sight of a bearded policeman.

H.P. OR C.C. ?

The Question of Manufacturers' Nominal Horse Power and the More Equitable Method of Designating Power by Capacity.

OUR readers will no doubt have noticed that for months past we have very seldom referred to manufacturers' nominal h.p. in designating a particular model. There have been so many anomalies that it became desirable for us to take the lead and to classify the various motor cycles by the capacity of their engines in cubic centimetres.

The makers' nominal h.p. is not a unit of power; it is not even a rough guess at the power developed—it is merely a habit. For years the 500 c.c. engine has been known as a "3½ h.p.," and a 350 c.c. as 2¾ h.p., 250 c.c. as 2¼ h.p., and so on. If all makers had used the same figure for engines of the same size, it might not have been so desirable to institute a change. But whereas some manufacturers listed 500 c.c. machines as 3½ h.p., others (sometimes fitted with the same engine unit) termed them 4 h.p. The maker of a 633 c.c. machine terms his motor cycle a "big four," another regards a 550 c.c. as a 4 h.p. machine, yet another having an engine of 557 c.c. decides upon 4¼ as the nominal h.p.

Insurance Anomalies.

It is easy to see that not only are these "nominals" confusing, but they convey no meaning. Notwithstanding, the insurance companies fix their schedules on manufacturers' nominal ratings, and, to quote a well-known example, the owner of a 499 c.c. Rover or Blackburne is forced to pay as much as the rider of a 633 c.c. Norton.

Twelve months ago the Auto-Cycle Union instituted what is termed the A.C.U. h.p. rating, which is the rating of power on the decimal system, accepting 100 c.c. as 1 h.p. Thus 250 c.c. became 2.50 h.p.

For certain reasons the trade has not taken to the A.C.U. idea, and we have yet to see a catalogue in which the old figures have been abandoned and A.C.U. rating substituted.

But why use the h.p. unit at all? Because James Watt originated a unit of power is no reason why we should use it to indicate size. It was never intended for this purpose. 500 c.c. or 250 c.c. conveys more to the mind than 5.00 h.p. or 2.50 h.p., because it cannot be confused with *existing nominals*.

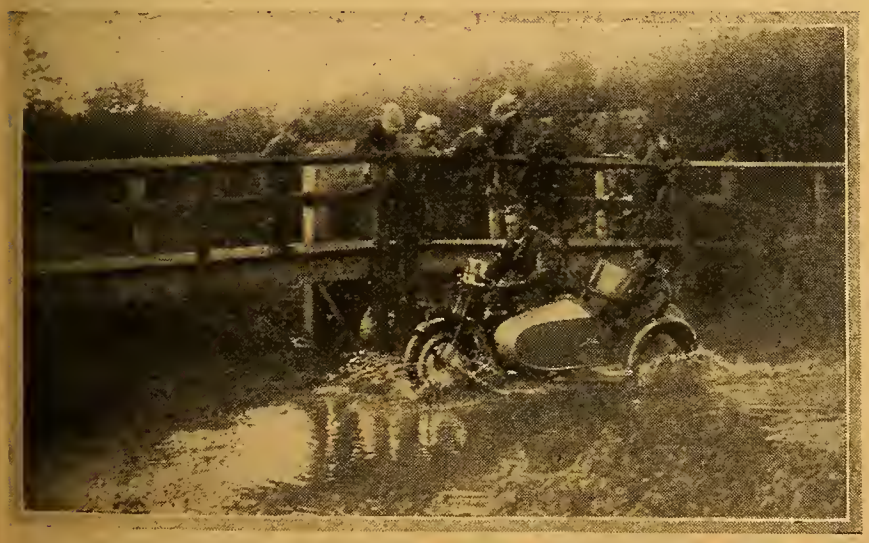
A letter on this wide subject from the Villiers Engineering Company is given below.

> "We would draw your attention to the anomalies existing in the motor cycle manufacturers' h.p. rating of internal combustion engines, and the serious consequences it may have on the development of the lightweight motor cycle.
>
> "Here is a specific case which shows the absurdity of the h.p. rating now in existence. One large firm lists two engines, a 293 c.c. and a 350 c.c.; both are rated at 2¾ h.p., with the result that the insurance premium is exactly the same because the manufacturer's rating is the same.
>
> "At the present moment we are manufacturing three sizes of engines, 150 c.c., 250 c.c., and 350 c.c., and we have rated them on the basis that one horse-power equals 100 cubic centimetres, so they will be 1½ h.p., 2½ h.p., and 3½ h.p. respectively.
>
> "This is undoubtedly the correct method, and was ventilated by the Press at the latter end of last year.
>
> "As the largest manufacturers of two-stroke engines in Great Britain, it is our intention to supply engines so that they may be fitted to motor cycle frames and sold to the public at a reasonable figure, but when the insurance companies base the premium on the maker's present h.p. rating the rider is not receiving the full benefit from his purchase.
>
> "For instance, our 1½ h.p. engine will be rated the same as the J.A.P. 350 c.c., while the 3½ h.p. will be rated the same as the 500 c.c. Sunbeam or Triumph, although of considerably less h.p.
>
> "Numbers of low-priced motor cycles are purchased on the instalment system, and they have to be insured by the purchasers. If the insurance premium of the very small engine is as much as the comparatively large one it is putting a severe handicap on a rider who can ill afford it.
>
> "Several formulæ on h.p. rating exist, all giving different results; the only equitable method is by the cubical contents of the cylinder.
>
> "An alternative method of insurance well worth serious consideration is to assess the premium on the selling price or estimated value of the motor cycle.
>
> "We have already written to the important insurance companies, but so far without any tangible results.—THE VILLIERS ENGINEERING CO., LTD."

Classification by Capacity Only.

It will be noted that this important firm of engine unit manufacturers, while abandoning the common h.p. rating, still intends to rate its engines on a h.p. basis. The only difference between the existing system and the rating which the Villiers Co. propose to use is that the average nominal h.p. has no basis, while the other takes as a basis 100 c.c. =1 h.p.

We reiterate: Why use h.p. at all? *If every manufacturer abandoned h.p., insurance companies would have to consider engine capacity,* and anomalies would eventually disappear.



YET ANOTHER WATER SPLASH. Youthful enthusiasts watch H. S. Perry (B.S.A. sidecar) make light of the Yardley Wood watersplash in the Birmingham M.C.C. trial last Saturday.

£10,000,000 FROM MOTOR TAXES IN NINE MONTHS.

TABULAR statistics of vehicle taxation receipts from December 1st, 1921, to August 31st, 1922, have been issued by the Ministry of Transport.

The total gross receipts amount to £10,835,417, of which motor cyclists contributed £908,069.

The average receipt for each whole year motor cycle licence was £2 13s. 6d., and for each motor car licence £17 12s. On August 31st, 377,000 motor cycles were registered in Great Britain, against 314,000 motor cars—63,000 more.

Quarterly licences are not proving so popular as was anticipated. More than half the country's motor cyclists register for the full period of 12 months.

CURRENT CHAT (continued from p. 579)

THE WILLING HORSE. One of the entrants in last week's gliding competition using his B.S.A. to drag his monoplane to the top of the hill.

Brooklands Meet on Armistice Day.

It has been decided to hold a further Brooklands meeting on Armistice Day, under the combined auspices of the B.M.C.R.C. and the B.A.R.C., when the entire proceeds will be devoted to the Weybridge Remembrance Day Fund. This event, it is stated, has the full approval of many of the local residents, who had previously complained of the noise of the track.

SMALL CARS AND LARGE CARS.

"THE AUTOCAR," THE COMPLETE JOURNAL.

Every phase of automobilism is embraced by "The Autocar," the sister journal of "The Motor Cycle."

Light, medium and large cars are adequately covered in its pages. No artificial division of light cars from other types is attempted, or, indeed, is necessary, since the principles of design are identical and the interests of users, whether concerning questions of upkeep, taxation, roads, service or future development, are undivided and common to all.

Thus, "The Autocar"—The pioneer and the largest of all motor journals—forms the only complete record of the automobile movement, by embracing the interests of motorists in general.

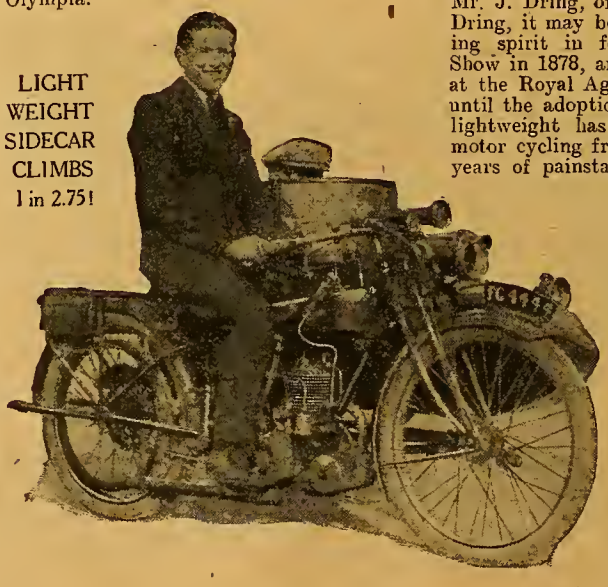
The Ilkley Trial.

Several valuable awards will be competed for in the Ilkley M.C. and L.C.C.'s reliability trial, which is to take place on Saturday next. The trial will start at the club's headquarters, The Lister's Arms Hotel, Ilkley.

"The Motor Cycle" Film.

Following the announcement concerning *The Motor Cycle* film in last week's issue, we again remind club secretaries that application for dates for *The Motor Cycle* film should be sent at once. The film will be put into circulation as soon as possible after the Motor Cycle Show at Olympia.

LIGHT WEIGHT SIDECAR CLIMBS 1 in 2.75!



Another 350 c.c. Solo Single.

The Martinsyde name will appear at the Show on a small single-cylinder machine as well as the big-twins. Its price is not yet fixed, but it will be competitive.

Ulster Grand Prix Course.

The triangular course used for the Ulster Grand Prix evidently permits high speeds, since the record lap (20½ miles) was covered at a speed of 65.77 m.p.h. by H. Langman (532 Scott).

Motor Cycles and Cars.

In August there were 377,943 motor cycle and 314,769 car licences in force. The proportion of motor cycles should be still higher next year with the increasing number of miniature low-priced machines.

Millions!

An obvious German walked into a Great Portland Street dealer's showroom and asked the price of a certain three-wheeler. On being told he made a brief calculation, and said, "Dree million marks—too dear, too dear!"

Raising the Compression.

Little or no extra power is obtainable from any special dope mixture is the opinion of Mr. J. A. Prestwich. Dope simply means that a higher compression ratio may be used without overheating.

The More Sporting Race.

The difference between a Brooklands car and motor cycle race meeting seems to be that one can never bank upon a motor cyclist coming round a second time. There is a more sporting atmosphere about a motor cycle meeting however.

A Lightweight's Name.

The J.D. lightweight described in *The Motor Cycle* of September 28th last, and which has recently been reduced to £35, derives its name from the initials of Mr. J. Dring, of Bowden Wire, Ltd. Mr. Dring, it may be remarked, was the moving spirit in founding the old Stanley Show in 1878, an exhibition held annually at the Royal Agricultural Hall, Islington, until the adoption of Olympia. The J.D. lightweight has been introduced to the motor cycling fraternity after nearly three years of painstaking development.

First ascent of Alms Hill, Henley, by a lightweight sidecar outfit has been made by L. A. Welch on a 292 c.c. O.K.-Junior. The attempt was the result of a wager, but was officially observed and certificated by the A.C.U. The gear ratios used were 6·5, 13·75 and 21 to 1. Welch is a private owner.

Club News

Worcester and District M.C.C. and Worcestershire M.C.

The above clubs will hold jointly their annual dinner on Thursday, December 7th.

West Herts M.C. and L.C.C.

A closed half-day trial will be held on the 29th inst. Full particulars are obtainable from the hon. secretary at 18, Church Street, Rickmansworth, and new members to the club will be welcomed.

Inverness and District M.C.

Held under favourable weather conditions, the club's one-day trial was run off successfully on the 2nd inst. The course embraced three well-known hills—Abriachan, Gleadoe, and Invertarigaig. Results:—

SOLO.—1, K. J. Mackintosh (490 Norton) and W. Grant (557 B.S.A.); 2, W. Walker (498 Ariel) and W. Macdonald (550 Triumph).

SIDECAR.—1, W. Smith (654 Rover sc.); 2, V. Stewart (993 Matchless sc.).

TEAM PRIZE.—Inverness team, consisting of: W. A. Welker (498 Ariel), A. Macdonald (350 Beardmore B. and S.), W. Bullock (349 A.J.S.), J. Mackenzie (293 Connaught).

Dublin Ramblers' M.C. and L.C.C.

Results of the club's reliability trial, described in *The Motor Cycle* of the 12th inst., are as follows:—

CREUSS CHALLENGE CUP.—H. G. Ellerker (349 A.J.S.).

FIRST CLASS AWARDS.—C. H. Pitman (492 Sunbeam), C. Creuss Callaghan (500 N.U.T.), H. W. Nesbitt (490 Norton), J. A. Carville (557 B.S.A.).

SECOND CLASS AWARDS.—R. Treacy (550 Triumph), E. Treacy (596 Indian).

THIRD CLASS AWARDS.—G. Cooke (492 Sunbeam), A. G. Coard (596 Indian), G. Creuss Callaghan (550 Triumph).

SPECIAL AWARDS.—Two-stroke Class, G. I. Kennedy (249 Velocette); 350 c.c. Class, F. C. Hanley (348 Raleigh); Unlimited Class, J. A. Carville (557 B.S.A.).

TEAM PRIZE.—H. G. Ellerker (349 A.J.S.), G. Cruess Callaghan (550 Triumph), C. Cruess Callaghan (500 N.U.T.).

It was previously inadvertently announced that the club had become open to trade members; this is incorrect.

Surrey M.C. and L.C.C.

Saturday, the 28th inst., is the date fixed for the Bateman Cup Trial, to be run on a course of seventy miles, in two non-stop sections. A flexibility test will take place at the commencement of the run. Competitors will leave Puttenham cross-roads on the Hog's Back, near Guildford, at 2.30 p.m.

Surbiton M.C.

The postponed half-day reliability trial for the Ballard's Challenge Cup has now been fixed to take place on the 28th inst., starting from the Angel Hotel, Thames Ditton, at 2.30 p.m. At the conclusion of the trial an impromptu concert and dance will be held at the Talbot Hotel, Ripley.

Slough and District M.C. and L.C.C.

Held over a difficult course of 80 miles, and concluded in darkness, the club's first annual reliability trial was run off on the 7th inst. Results in the motor cycle classes are as follows:—

HARRIS CUP AND GOLD MEDAL.—E. A. Cullum (348 Douglas).

GOLD MEDAL.—B. F. G. Fowke (350 Beardmore B. and S.).

Dublin and District M.C.C.

The club held an open hill-climb on Saturday, the 14th inst., at the Devil's Elbow, near Glencullen, a freak type of hill that is more a test of the skill of the driver than of the power of the cycle. This fact was clearly demonstrated, as while the winner of the under 600 c.c. class, G. C. Callaghan (550 Triumph), won the award for the fastest ascent of the afternoon, he was only a second faster than S. Woods (349 Cotton) and 1⅗ secs. faster than the best of the two-stroke class, R. Humphreys (247 Velocette). The placings in the four classes into which the competitors were divided were as follows:—

300 c.c. CLASS (two-stroke).—1, R. Humphreys (247 Velocette), 27⅗s.; 2, T. F. Slevin (247 Velocette), 27⅘s.; 3, J. A. H. Waters (225 Enfield), 28⅘s.

350 c.c. CLASS (four-stroke).—1, S. Woods (349 Cotton), 27s.; 2, D. Murphy (349 Coventry-Eagle), 32⅕s.; 3, H. B. Evans (348 Excelsior), 32⅖s.

351 to 600 c.c. CLASS.—1, G. C. Callaghan (550 Triumph), 26s.; 2, A. A. Wayte (492 Sunbeam), 27⅗s.; 3, J. A. Carville (557 B.S.A.), 27⅘s.

SIDECAR CLASS.—1, E. F. Ashton (998 Indian), 27⅖s.; 2, D. Allen (633 Norton), 27⅘s.; 3, W. J. Burney (976 Enfield), 30⅕s.

PREVENTING TIES. To find a winner in a modern reliability trial of average difficulty it is almost essential to include some auxiliary timed competition. An acceleration test was used to allocate the cup in the Sutton Coldfield event described last week.

Lune Valley M.C.C.

Official results of speed trials held on the 22nd ult. are now to hand, and are as follows:—

GENERAL. 275 c.c.—1, T. H. Amery (269 New Scale), 38.3s.; 2, G. E. Tottey (249 New Imperial), 38.4s.; 3, J. Whalley (249 Massey Arran), 39.1s.

EXPERT BARRED. 275 c.c.—1, T. H. Amery (269 New Scale), 38s.; 2, G. E. Tottey (249 New Imperial), 38.4s.; 3, A. W. Muirhead (249 D.O.T.), 43.1s.

GENERAL. 350 c.c.—1, J. Cooke (348 Edmund), 33s.; 2, S. A. Marks (348 Hawker), 34.2s.; 3, J. C. Dearden (349 Massey Arran), 35.1s.

EXPERT BARRED. 350 c.c.—1, J. Cooke (348 Edmund), 32s.; 2, S. A. Marks (348 Hawker), 32.3s.; 3, J. C. Dearden (349 Massey Arran), 35.1s.

GENERAL. 600 c.c.—1, J. W. Hollowell (490 Norton), 28.4s.; 2, H. Baxter (490 Norton), 30.3s.; 3, A. Hawkins (490 Norton), 31s.

EXPERT BARRED. 600 c.c.—1, J. W. Hollowell (490 Norton), 28.1s.; 2, H. Baxter (490 Norton), 29.4s.; 3, T. Sinister (490 Norton), 30.1s.

GENERAL (UNLIMITED).—1, J. W. Hollowell (490 Norton), 28.1s.; 2, N. S. Nicholas (976 D.O.T.), 28.2s.; 3, H. Baxter (490 Norton), 29.1s.

EXPERT BARRED (UNLIMITED).—1, A. Tinkler (999.5 American X.), 27.1s.; 2, N. S. Nicholas (976 D.O.T.), 28.3s.; 3, J. W. Hollowell (490 Norton), 28s.

GENERAL (600 c.c. SIDECARS).—1, J. W. Hollowell (490 Norton), 32.3s.; 2, H. Baxter (490 Norton), 35.3s.; 3, C. G. Bullough (490 Norton), 36.2s

EXPERT BARRED (600 c.c. SIDECARS).—1, J. W. Hollowell (490 Norton), 33s.; 2, H. Baxter (490 Norton), 36.1s.; 3, A. Jepson (498 Zenith-Bradshaw), 39.3s.

GENERAL (UNLIMITED SIDECARS).—1, J. W. Hollowell (490 Norton), 33.2s.; 2, P. Platt (749 Bradbury), 34.1s.; 3, E. B. Parkinson (976 Brough-Superior), 37s.

EXPERT BARRED (UNLIMITED SIDECARS).—1, A. Tinkler (999.5 American X.), 32.3s.; 2, J. W. Hollowell (490 Norton), 33.2s.; 3, P. Platt (749 Bradbury), 35.3s.

Fastest time of the day.—A. Tinkler (999.5 American X.), 27.1s.

Brighton and Hove M.C.C.

Results in the motor cycle classes of a successful hill-climb, held on the 7th inst. over a 440 yards course, are as follows:—

SIDECARS UP TO 600 c.c. (GENERAL).
1. C. Volk (494 Douglas sc.), 24⅖s.
1. A. Fraser (498 Sheffield-Henderson sc.), 23⅘s.

UNLIMITED SIDECARS (GENERAL).
1. A. Fraser (Sheffield-Henderson sc.), 23⅘s.
2. C. Volk (494 Douglas sc.), 24⅖s.
2. B. S. Allen (976 Brough-Superior sc.), 24⅖s.
3. J. Bowles (976 Zenith sc.), 30⅘s.

350 c.c. (AMATEUR).
1. W. H. Sheraton (349 Sheffield-Henderson), 21⅕s.
2. A. C. Quick (348 Rex-Acme), 24s.

350 c.c. (GENERAL).
1. W. H. Sheraton (349 Sheffield-Henderson), 20⅕s.
2. S. Duntord (348 Veras), 20⅘s.
3. A. C. Quick (348 Rex-Acme), 21⅕s.

600 c.c. (AMATEUR).
1. W. H. Sheraton (349 Sheffield-Henderson), 19⅖s.
2. A. H. Cox (499 Triumph), 20s.
3. A. C. Quick (348 Rex-Acme), 20⅗s.

600 c.c. (GENERAL).
1. A. Fraser (498 Sheffield-Henderson), 19s.
2. W. H. Sheraton (349 Sheffield-Henderson), 19⅖s.
3. C. Volk (494 Douglas), 19⅗s.

UNLIMITED (AMATEUR).
1. W. H. Sheraton (349 Sheffield-Henderson), 19⅗s.
2. A. H. Cox (499 Triumph), 20⅗s.
3. R. Green (490 Norton), 21⅗s.

UNLIMITED (GENERAL).
1. B. S. Allen (976 Brough-Superior), 18⅗s.
2. A. Fraser (498 Sheffield-Henderson), 18⅘s.
3. A. H. Cox (499 Triumph), 19⅗s.
3. C. Volk (494 Douglas), 19⅗s.

UP TO 600 c.c. (AMATEURS WHO HAVE NOT RECEIVED AN AWARD IN A B. AND H.M.C.C. HILL-CLIMB.)
1. A. H. Cox (499 Triumph), 20⅖s.

OVER 600 c.c.
1. C. C. Bone (976 Dot-Jap), 22⅖s.

FASTEST TIME OF THE DAY.—B. S. Allen (976 Brough-Superior), 18⅗s.

Stourbridge and District M.C.C.

Several stiff hills were included in a reliability trial held on the 7th inst. Starting from the Woodman Hotel, Clent, competitors made two 15-mile circuits over the Clent and Licky Hills, riding to a schedule of 15 m.p.h. An awkward hairpin on New Walton Hill was the cause of many failures, only one solo rider making a clean ascent on both circuits. Two ladies competed.

Redhill, Reigate and District M.C.C.

The results of the secret hill-climb held on the 4th inst., were quite satisfactory despite the enforced alteration of plans at the last minute and a certain amount of rain. Competitors were allowed two attempts on the hill, the fastest time counting in each event.

350 c.c. (GENERAL).—1, A. Livsey (349 Wooler); 2, R. Green (249 Velocette).

600 c.c. (GENERAL).—1, R. Green (490 Norton); 2, A. Livsey (349 Wooler).

1,000 c.c. SIDECARS.—1, V. Long (770 Excelsior sc.); 2, E. Gordon (989 Harley-Davidson sc.); 3, F. Harris (978 J.A.P. sc.).

South Western Centre A.C.U.

Everyone who completed the course in the inter-club reliability trial over Dartmoor on September 30th, is to be heartily congratulated, for not only was the route very rugged, but the competitors' tribulations were made greater by a persistent drizzle, and in the latter stages by heavy fog. Nevertheless it must have been encouraging to the Plymouth and District Motor Cycle and Light Car Club, which organised the trial, to find thirty-four competitors face the starter, among these being entrants from Barnstaple, Tiverton, Okehampton, and London.

There was no great impediment in the first few miles, and even Grenoffen (an observed hill) did not catch many. Within the next three miles the hairpin on the hill leading from Buckland to Denham Bridge was encountered on the downward road, but at this stage the field was making capital progress. The remainder of the first lap did not present very much difficulty, and, after passing through Crapstone, the main road to Tavistock was followed *via* Donsland, Princetown, and Merrivale. So far 47 miles had been covered, and nearly everyone was wet through, while quite a number were late in checking in.

Lunch was provided at the Newmarket Hotel, after which the second lap was entered on. The riders seemed quite undaunted, despite the heavy rain which fell in blinding sheets as the road to Okehampton was taken, after which the course again proved of a strenuous character. The road was principally over open moorland, and ran through Belstone, Skaigh, Sticklepath, Ramsley, Throwleigh, Gidleigh, Minchington (observed hill), and then through Chagford, Drewsteignton, Moretonhampstead, and Postbridge to Two Bridges, where a halt was made for tea. By this time only fifteen competitors remained to finish the course.

On the last section the *pièce de résistance* was Simms' Hill, with a gradient of 1 in 2.5, and this proved a stumbling block to many. Three competitors made capital ascents—P. Pike (Norton), B. D. Richardson (Norton), and a Brough Superior rider—but the remainder either stuck completely or had to receive assistance from onlookers. The greasy lane from the top of this hill to New Inn ended the more tricky part of the journey so far as gradients were concerned, but heavy fog made the last thirty miles treacherous so far as time error counted, and it was not surprising to find that one or two got fog-bound and did not return to Plymouth until the following morning.

Only twelve checked in, as follows: L. Bastin (498 Martinsyde), N. Veasey (532 Scott), O. Brittain (349 Douglas), B. D. Richardson (490 Norton), P. Pike (490 Norton), F. Easterbrook (Martinsyde sc.), J. Hoskin (976 Zenith), T. T. Drew (550 Triumph), J. R. Shobrook (349 A.J.S.), F. B. Millsom (James), and Illingworth (Trump-Anzani sc.).

P. Pike (490 Norton) won the cup.

North Liverpool M.C.C.

The club held its first speed trials on the beach, Birkdale, near Southport, on the 7th inst. Excellent weather favoured the meeting, and some very close finishes were witnessed by over a thousand spectators. Several well-known T.T. and track riders competed. The organisation was exceptionally well carried out by club officials, assisted by R.A.C. guides and local mounted police. Results:

SOLO CLASSES.

300 c.c. (TRADE).—1, T. Amery (249 New Scale).

300 c.c. (EXPERT).—1, T. Amery (249 New Scale); 2, J. N. Roberts (249 New Imperial).

350 c.c. (AMATEURS).—1, C. H. Foster (348 New Scale); 2, T. Amery (249 New Scale); 3, T. Picton (349 A.J.S.).

350 c.c. (TRADE).—1, H. F. Brockbank (348 Brock-Blackburne); 2, P. Baron (348 Hawker); 3, T. Amery (249 New Scale).

350 c.c. (EXPERT).—1, H. F. Brockbank (348 Brock-Blackburne); 2, P. Baron (348 Hawker); 3, F. Collard (349 Sheffield-Henderson).

550 c.c. (AMATEURS).—1, J. W. Hollowell (490 Norton); 2, W. Johnson (492 Sunbeam); 3, S. Ollerhead (494 Douglas).

550 c.c. (TRADE).—1, G. E. Cowley, jun. (490 Norton); 2, W. Johnson (492 Sunbeam); 3, H. Baxter (490 Norton).

UNLIMITED (EXPERT).—1, A. Tinkler (999.5 American X sc.); 2, G. E. Cowley, jun. (490 Norton sc.); 3, P. Baron (348 Hawker sc.).

Epsom and District M.C.C.

Three well-known Surrey hills—White Downs, Succombs, and Quarry Hill—were included in the club's one-day trial held on the 8th inst. Competitors had to make two circuits of the course, a total distance of 166 miles, to a 20 m.p.h. schedule. Final results were as follows:—

GOLD MEDALS.—P. C. Pothill (976 Zenith sc.), S. Bucknell (976 Matchless sc.), J. E. Starnes (678 Martinsyde sc.).

SILVER MEDALS.—R. Holt (550 Triumph), H. Garland (550 Triumph), W. H. Steer (499 Sunbeam).

Bradford M.C. and L.C.C.

It was originally intended to run off the handicap speed trials on the 7th inst. in pairs on the knock-out principle, but the surface was found to be too rough; competitors were despatched singly against handicap. Forty riders were entered, and thirty-five started. The distance was one-third mile. Results:

SOLO CLASS.—1, Silver Cup (won outright), T. Bullus, Junr. (555 P. and M.), gross 35.16s., received 12s., net 23.16s.; 2, Silver Medal, H. S. Moorhouse (499 Triumph), gross 27.5s., received 3s., net 24.5s.; 3, Bronze Medal, S. Flintoff (558 Triumph), gross 34.64s., received 10s., net 24.64s. Fastest time, solo, H. S. Moorhouse (499 Triumph), 27.5s.

SIDECAR CLASS.—1, Silver Cup (won outright), E. Flintoff (499 Sunbeam sc.), gross 39.6s., received 8s., net 31.6s.; 2, Silver Medal, H. Graham (490 Norton sc.), gross 38.32s., received 4s., net 34.32s.; 3, Bronze Medal, J. A. Smith (490 Norton sc.), gross 35.12s., scratch, net 35.12s. Fastest time, sidecar class, J. A. Smith (490 Norton sc.), 35.12s.

Ipswich and District M.C.C.

A half-day reliability trial for the Paviour Trophy took place on the 7th inst. Several very loose pieces of going figured in the 60 miles course, and many competitors came to grief. A lady rider, Mrs. Keer, handled her Triumph sidecar outfit very capably. Results:—

350 c.c.—1, J. Pretty (349 A.J.S.); 2, R. A. Devonish (350 Beardmore-Precision); 3, W. J. Coe (249 Velocette).

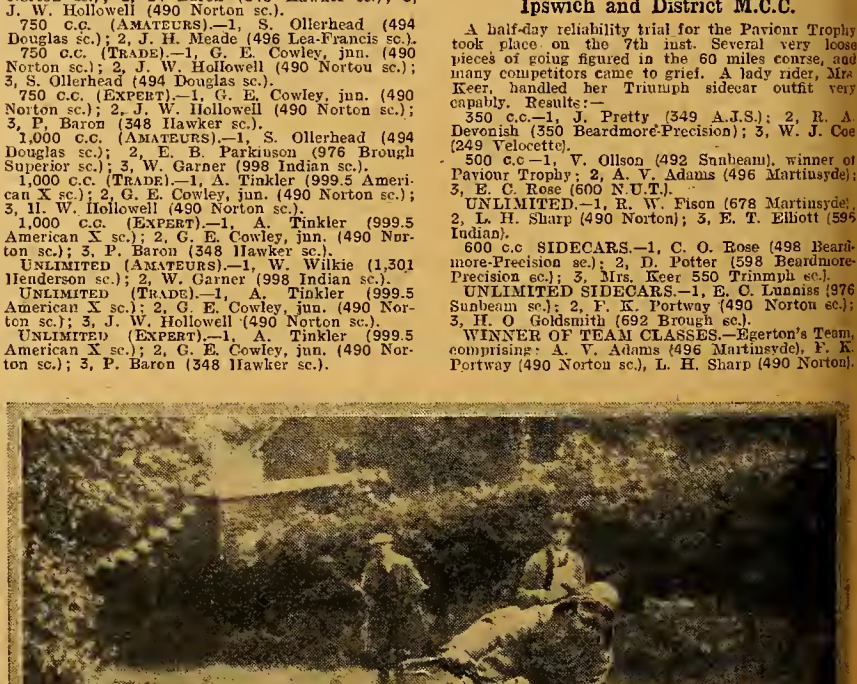
500 c.c.—1, V. Ollson (492 Sunbeam), winner of Paviour Trophy; 2, A. V. Adams (496 Martinsyde); 3, E. C. Rose (600 N.U.T.).

UNLIMITED.—1, R. W. Fison (678 Martinsyde); 2, L. H. Sharp (490 Norton); 3, E. T. Elliott (596 Indian).

600 c.c SIDECARS.—1, C. O. Rose (498 Beardmore-Precision sc.); 2, D. Potter (598 Beardmore-Precision sc.); 3, Mrs. Keer 550 Triumph sc.).

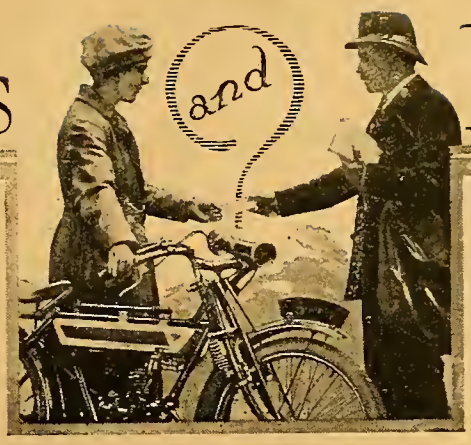
UNLIMITED SIDECARS.—1, E. C. Lunniss (976 Sunbeam sc.); 2, F. K. Portway (490 Norton sc.); 3, H. O Goldsmith (692 Brough sc.).

WINNER OF TEAM CLASSES.—Egerton's Team, comprising: A. V. Adams (496 Martinsyde), F. K. Portway (490 Norton sc.), L. H. Sharp (490 Norton).



BETTER FOOT THAN FALL—evidently the motto of F. R. Dixon (490 Norton) on the greasy hairpin bend of New Walton Hill in a Stourbridge and District M.C.C. trial

Questions and Replies



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

CAPACITY IN RELATION TO POWER.

Q. I have a Scott with many modern parts, but the main frame and engine both are 1912-13. The engine and gears have been thoroughly overhauled and worn parts renewed. Taking the capacity of this engine, which is now as good as a new one, as identical with the capacity of, say, a 1920 engine in similar condition, would I be justified in expecting it to develop the same power. I might say the carburetter is a 1920 three-jet Binks; the magneto a Bosch, of the same age as engine, probably, whilst lubrication is by the 1917 Scott system. Assuming the power of 1920 engine greater, would this be due to crank case or cylinder improvement or what?—W.A.M.

A. As the 1920 Scott engines have several improvements in detail over the pre-war pattern, it is not certain that you will get the same power from your machine; at the same time there will not be much difference if your engine is in really good order. The post-war Scott engines are improved by having a slightly higher crank-case compression, and the casting of the passages in the crank case, transfer ports, and cylinders is much cleaner. The later engines also have machined ports in the cylinders, and the results obtained generally make for greater efficiency.

CHOOSING A SIMPLE SIDECAR.

Q. I am thinking of buying a sidecar outfit, but expense is a consideration. Having no mechanical knowledge and very little time to spend on a machine, it seems to me, from a study of your pages, that a two-stroke would probably be best suited to my purpose. If practicable, I should ride the machine (with empty sidecar) from the suburbs to my office in the City. (1) Is a two-stroke more suitable than a four-stroke for an inexperienced rider? (2) Does an air-cooled two-stroke develop sufficient power to pull a combined weight (passenger and driver) of 20 stone? (3) What is the minimum engine size necessary to do this? (4) Would it be safe to ride a lightweight two-stroke with empty sidecar from the suburbs to the City. I have in mind the possible danger of the outfit turning over when going round corners?—J.G.

A. (1) There is no particular advantage in selecting a two-stroke, even if you are only a beginner, because modern four-stroke engines are so reliable that there need be no alarm at their increased number of working parts as compared with two-strokes. (2) At very low speeds, and especially when pulling a sidecar, a two stroke is slightly more powerful than a four-stroke of the same capacity. (3) For the load which you intend to carry, we do not think it would be advisable to have a machine of less than 500 c.c. (4) A lightweight two-stroke with an empty sidecar would be quite suitable for use in travelling between the suburbs and city, and once you become used to it, and providing you always drive carefully, there would be no particular danger arising from the tendency of the sidecar to lift on left-hand corners. If your sidecar is only to be used for passenger carrying occasionally, or merely for short pleasure trips at moderate speed, it would not be be-

SUNSHINE IN OCTOBER. L. Randles (498 Sunbeam) on the bend of Ffrith Hill in the Reliance Cup Trial described last week.

yond the power of a two-stroke machine of 350 c.c. capacity to perform your work fairly satisfactorily. Such machines, however, are mostly being driven to the full extent of their power when a passenger is being carried, and consequently they are very liable to be too highly stressed, with resultant trouble and expense in maintenance, unless very considerately handled.

READERS' REPLIES.

TWO-STROKE CONSUMPTION.

With reference to "C.E.B.'s" question (October 12th), a Clyno two-stroke requires a very big advance on the spark for economy. I improved my m.p.g. from 50 to 100 as follows: I adopted the timing advised in the Amac handbook for two-strokes, namely, a full advance of 10 mm. Unless one is prepared to measure this through the sparking plug hole it is best to mark T.D.C. on the flywheel, set ignition at full retard, points just starting on T.D.C., then mark full advance on the flywheel, disconnect again and set full retard, points just opening on a mark halfway between the two marks on the flywheel; the firing point on full advance will be about 10 mm. from the top.

For starting up the lever will have to be about half retarded. Always run on full advance at once after starting up, except on a fairly big hill or in awkward traffic.

The jet should be reduced to No. 20. I am using No. 20 and still have full air and full throttle on the level. I also put a muffler made of an old tin can over the carburetter vaporising chamber, and draw my air from the open bottom of it just over the expansion box of the exhaust.

Aviation spirit gives a greatly improved freedom from four-stroking when running light; the vaporisation is much better. When I next touch my carburetter I intend to put in a No. 19 jet. Of course the extra air inlet wants watching, and unless carefully adjusted at all times there will be popping back in the carburetter. —J. HIPKIN.

DISAPPOINTING PERFORMANCE WITH A SIDECAR.

"J.O.E.'s" machine certainly has plenty to do, but according to my experience of a similar outfit it should be capable of doing it. I have a lighter sidecar than "J.O.E.," but can travel three-up comfortably. 5½ to 1 is rather high for such a load, but before discarding his 2½in. tyres "J.O.E." might try to obtain a belt rim ½in. bigger in diameter. This would make his gear about 5.5 to 1. The clutch should be as easy as the load will permit, there being no shock absorber. Size 36 jet is correct. I found my engine got hotter on smaller sizes: I have not tried 37, but should think it would improve the power (not the m.p.g. though). I have been doing 60 m.p.g. up to a few weeks ago, when it mysteriously improved to 71. An inlet valve air leak preventer helps a lot. Petrol level should be as high as possible. The small gauze in the float chamber cap is a point to watch. Tappet clearances should be as small as possible. I use a thick washer between cylinder and crank case—about ten thicknesses of brown paper, goldsized together. Price's Huile de Luxe, about 1 pumpful every 5 miles, suits the engine well. I am at present using a K.L.G. F12 plug, which the makers recommend, but the K.L.G. H.S.1 gives me equal satisfaction and is considerably cheaper. I suppose "J.O.E.'s" exhaust system is clean: the slotted end of the tail pipe is best cut off, slantwise.—R. A. IRVING.

As I am the owner of a 1920 500 c.c. Ariel outfit a few experiences will perhaps be helpful to "J.O.E.," whose machine appears to be of the same type.

When delivered the machine was not too good in performance, but I fitted a 36 jet to the B. and B. carburetter and adjusted the level to a "bead on the jet." The petrol pipe and filter were choked and required a very thorough clean. I next retarded the ignition one tooth and ground off the end of the decompressor camshaft $\frac{1}{16}$in., as this fouled the inside of the crank case and stuck up the tappet. I also fitted F.E.W. valve attachments and a K.L.G. plug. I also scrapped the tail pipe and fitted a 39in. plain steel pipe over the silencer union. First-class compression is essential on this engine, which must be very carefully run in. I can now stand on the kick-starter for two minutes without it dropping.

After these adjustments, *plus* 500 miles running-in, the results are splendid. The outfit will now climb Westerham on middle gear fully laden and accelerate after the corner. The top gear 5½ to 1 is the best possible. I use Vacuum B oil and Miracle oil in the petrol. The machine has actually more power than three bigger singles I have owned, and on low gear laughs at Porlock. Over-heating is unknown, although the combined weight of passengers is 21 stone.—E. H. LARNER.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

"W.McK." (Belfast).—293 c.c. New Imperial: speed, petrol consumption, steering and reliability.

"G.P." (Burnley).—499 c.c. Sunbeam: carburetter other than Amac.

"D.J.O." (Sway).—349 c.c. sports A.J.S. and 490 c.c. Norton: speed, petrol and oil consumption, reliability.

"C.F." (West Bromwich).—1,301 c.c. Henderson sc.: petrol consumption, lubrication system, gear ratios; also Cox Atmos carbnretter.

"G.S.S." (Norwich).—Late model 398 c.c. A.B.C.: general experience after 2,000 miles' running.

"E.J.S." (Muswell Hill).—398 c.c. A.B.C. and 349 c.c. A.J.S.: speed, reliability, cost of upkeep.

"N.T.B." (Watford).—398 c.c. A.B.C. (1922 model): correct handling.

"W.T." (Tewkesbury). — 499 c.c. Dunelt sc.: belt drive, fuel economy.

"M.C." (Woking).—500 c.c. N.U.T. sports model: speed, ease of cornering, acceleration, suitability of Wex or Flexi carburetter.

"H.N." (Croydon).—Scott repair service.

"A.T.D." (Charlton).—499 c.c. I.O.M. Rudge and 348 c.c. Raleigh: speed, reliability, power, and suitability for permanent pillion riding.

"J.J.G. Jnr." (Heswall).—349 c.c. A.J.S. B 1 and 247 c.c. Levis S 2: comparative running expenses, speed, reliability, fuel consumption, comfort.

"R.G.C.C." (Tunbridge Wells).—247 c.c two-speed Levis and 225 c.c. Royal Enfield: reliability, decarbonising periods.

"J.F." (Scarborough).—211 c.c. Ner-a-Car: single lever carburetter, headlight improvements, suitable plugs.

"A.J.D." (Glasgow).—499 c.c. Rudge-Multi: hill-climbing, fuel consumption, belt-slip in wet weather.

"R.J.H." (Southampton).—Old 678 c.c. Indian: suitable carburetter, solo speed, tuning hints.

"A.N.J." (Liverpool).—348 c.c. Cotton: speed, reliability, general economy.

"L.E.L." (Gainsborough).—596 c.c. Indian Scout: performance with sidecar, reliability, solo speed.

"R.H." (Ascort).—McKenzie lightweight: vibration and general behaviour.

SPARKLETS.

Found.

Near Henley, a Lucas motor cycle horn. Ref. No. 211.

Silencer and Power.

J. Emerson's recent 3 hours and 200 miles records at 65 m.p.h. were made with Carb-jector silencers fitted to his Douglas.

One Third Less than Pre-war Prices.

Considerable reductions in price have been made in Stepney Road-Grip motor cycle covers, which are now one-third less than pre-war figures.

Cycle Car Price Reduction.

Up to the end of 1922 the price of the Tamplin will be £150, complete with electric lighting. This machine is guaranteed to climb Alms Hill by its makers, Tamplin Motors, Ltd., Staines, Middlesex.

Pretoria Hill Climb.

Delightful weather favoured the Pretoria Motor Club's hill-climb on Klopper's Kop, over a half-mile course, electrically timed. The Nortons ridden by Downes, Du Toit, and Van Bergen finished first, second, and third respectively; Dr. Du Toit and Van Bergen tied for second place.

British Successes on the Continent.

At the Krachbergrennen hill-climb, near Erbach Odenwald, a 499 c.c. Triumph took first and four places in the 500 c.c. class, while in the 1,000 c.c. event Kleemann and Howie occupied first and second positions on similar machines, making fastest time of the day in all motor cycle and racing car classes. Schloemer, riding a 499 c.c. Triumph, was first in the 500 c.c. class in the recent Siebengebinge races; he covered the course of 210 kilometres in 3h. 4m.

C.A.V. Magnetos

BRITISH THROUGHOUT

have established an enviable reputation for reliability and consistent efficiency, both on road and track. The following are recent successes:—

At Brooklands:

Mr. R. N. JUDD, riding a Model 16 Norton, recently secured the following four world's records:

100 miles in 1 hr. 20 mins. 46 secs. - - 73.88 M.P.H.

2 hours, covering 147 miles, 1261 yards - 73.86 M.P.H.

i.e., 2 World's Records Class C
2 „ „ „ D

At Doncaster:

In the Speed Trials Mr. FRANK SISSON gained the following awards in Section B:—

550 c.c. Sidecar	- -	1st
750 c.c. „	- -	1st
Unlimited c.c.	- -	1st
550 c.c. Sidecar	- -	2nd
750 c.c. „	- -	1st

In Italy:

In the overnight race, from MILAN to NAPLES, a distance of 887 Kilometres or 551 Miles, the "Norton" secured First and Second places in the 500 c.c. class, and Second and Third places in the unlimited class, the times being 18 hours 3 mins. 42 secs., and 18 hours 21 mins. 16 secs. respectively.

All the above relied on C.A.V. MAGNETOS which in no small measure contributed to their success.

TWO-STROKE MOTOR CYCLES

By the staff of
"The Motor Cycle."

A complete treatise on the two-stroke motor cycle, written from the point of view of the rider.

ALL who are seeking information relating to two-stroke motor cycles should obtain a copy of this book. It fully describes the charm, the cost, and the possibilities of the two-stroke, deals in detail with the engine and other units. Useful advice is given on engine cleaning, tuning and adjustment, as well as on economical and efficient running and the best means of eliminating troubles. Illustrations are freely used throughout this book.

Price 2/6 net. By post, 2/9.

From ILIFFE & SONS LTD., Dorset House, Tudor Street, London, E.C.4.
and leading booksellers.

Have You secured your supply of

Miracoleum

The Ideal Oil for Upper Lubrication.

The demand is exceptional.
The results astounding.
Every Motorist should carry a tin.

Miracoleum

positively reduces friction and carbon at combustion head.
Lubricates valve stems and prevents them sticking.
Cuts down petrol consumption.
Increases compression and mileage.

You can use No. 3 Spirit and Miracoleum and obtain the same H.P. and mileage as with No. 1 Spirit.

Miracoleum is a Revolution in Rev olu

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable _____ & Co. to ILIFFE & SONS Ltd., and crossed _____ Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision, after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6 and on all transactions over £100, 1%. All deposit matters are dealt with at Dorset House, Tudor Street London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

GET IT AT

TAYLORS

Sole London and District Distributing Agents for A.J.S., Excelsior, and Cuneit Motor Cycles.

What is a real BARGAIN?

Not necessarily a motor cycle that is low in price.

Our idea of a real bargain is a sound machine that suits your needs, purchased at a low figure and backed by a genuine Guarantee such as Taylors give with New, Shop-soiled, or Second-hand Solo Machines or Combinations.

Here are some real BARGAINS ALL GUARANTEED

Sheen Park Lawn Tennis Club,
May 22nd, 1922.

Dear Sir,

I am instructed by my Committee to say they are very pleased with the Pavilion you erected for them.

Yours faithfully, JOHN O. GRIFFITS.

122, Shortlands Road,
Sittingbourne, Kent.
August 17, 1922.

Mr. Brodrick,
The South-Western Appliance Co.

Dear Sir,

The St. Helier Building arrived on Saturday, two days before promise of delivery, and we are more than satisfied with it.

We erected it on Wednesday and it went together like clockwork. I am very pleased we left the order with you, as all who have seen it think the value is remarkable and admire the artistic appearance. Trusting and believing it will get you further orders from this district.

Yours faithfully,
THOS. E. KENNETT.

TRAVERS LTD MOTOR SPECIALISTS NEWCASTLE

IGNITION, LIGHTING, ETC.

MAGDYNAMO Engineering Co., Ltd., for magnetos, spares, and repairs.

MOTOR Cyclists fit reliable high quality magnetos now and avoid certain failure of inferior magnetos.

BOSCH Enclosed Waterproof Type D.A.L. Magnetos, Government surplus, ready to fit on Indian, Harley, J.A.P., or any big single or twin, gives powerful spark at all engine speeds, makes your engine a real live engine, give you easy starting, smooth and rapid acceleration, high speed, and low fuel and oil consumption with increased power; price only £5 each, postage 1/6 extra; a 12 months' written guarantee sent out with each magneto. We give you satisfaction or refund cash.

PLEASE Note, the above type magnetos were originally manufactured for 200h.p. aircraft engines; therefore we have every confidence in claiming them to be the magneto you require for your big machine. Fit one to-day, and see life with a live machine.

HARLEY-DAVIDSON Owner writes: "Magneto to hand; many thanks for prompt despatch, satisfactory in every way; will recommend to my friends."

ZENITH Owner writes: "Since fitting magneto have completed a run of 250 miles; highly satisfied; will certainly recommend these magnetos."

INDIAN Machine Owners.—Your high-class machine deserves a high-class magneto: We want 1,000 Dixie 42° magnetos; send your magneto and £4 now, and we will immediately despatch you a Bosch D.A.L.

READY to fit on your machine; there are no alterations to make.

WHY is it that the leading Motor Cyclists—the men who know—are almost all sending to us for their Magnetos?

THERE must be a reason; there is; it is because the Magnetos of quality and guaranteed service, supplied by Magdynamo, beat all other Magnetos.

MAGDYNAMO will take your old Magneto in part payment.

REMEMBER your magneto is sent on 14 days' approval against cash per return on receipt of your order; there is no obligation to keep it until you have used it for 14 days on your machine and are satisfied; let us send you one now.

ARE You a Discerning Douglas Owner? Do you want a reliable magneto with 12 months' guaranteed service that will give you starting without worry, a smoother running, and more powerful engine and better results from your Douglas? Then send for a latest enclosed waterproof type Bosch XA2 magneto now, price only £5, carriage 1/6.

C.A.V. Magnetos (not converted starters), ready to fit on Triumphs, B.S.A.'s, Nortons, and P. and M.'s, with 12 months' guaranteed service, price £3/10, carriage 1/6.

THOMSON-BENNETT Magnetos latest enclosed waterproof type (not converted starters), ready to fit on 55° Clynos and 180° Douglas machines, with 12 months' guaranteed service, price £3/10, carriage 1/6.

MOTOR Cycle and Car Owners, are you testing all your sparking plugs properly? Are you wasting pounds yearly by throwing away good plugs? Fit a Bosch aeroplane hand starter magneto on your garage bench to-day and always have your sparking plug tester at hand, price £2, carriage 1/6.

TRADE discounts and export quotations.—Write, call, or 'phone for terms.

A YEAR'S guarantee on repairs. Before you scrap that magneto, whatever its condition, let us see it; we will rebuild your magneto to look and work like new, no matter what make, within 3 days or 24 hours if urgent, and return it with a written 12 months' guarantee. While your magneto is being repaired we can lend you another free of charge. We could not make these offers if we were not certain of the quality of our work.

YOUR old magneto will be equivalent to new at a low cost. Send us your defective magneto now.

ARMATURE rewinding, no matter what make, type, or size, 11/6. Wound cores from stock.

PISTON Rings, oversize or step-cut, 2/-; standard, 1/6; return post; none better. Thousands of testimonials.—Patent Rings, 30, Wigan Rd., Atherton. [5136

Re-conditioning of Cylinders—

The functions of a cylinder, piston and piston rings are inseparable from each other. Inaccuracy in any one of them promptly negatives the good qualities of the others. When your engine is losing compression and efficiency, send the cylinder to us to be re-conditioned. We will re-grind it to within .001 of an inch accuracy, and send it back complete with new piston and rings.

Our work is guaranteed, and our charges will appeal to you as a keen buyer.

THE REPAIR OF HUB GEARS.

On many occasions we are asked where parts and replacements for Armstrong and Sturmey-Archer hub gears can be procured. We recently paid a visit to the works of the Cromwell Engineering Co., 327, Putney Bridge Road, London, S.W.15, and were extremely well satisfied with the way repairs are carried out to epicyclic and other types of motor cycle gears. All parts are made on the company's premises, and all repairs are skilfully executed. It is interesting to note that during the war the Cromwell Engineering Co. were doing very accurate gauge work. They have special machinery for making gear wheels and for cutting the internally toothed rings used in the two hub gears mentioned. Repairs are also executed to countershaft gear boxes.

Everything fully guaranteed and at competitive prices. Official repairers to A.C.U. and R.A.C. —'Phone: Mid. 1928. [00

REPAIRERS.

FORFIELD Motors, Forfield Place, Leamington Spa, for repairs and overhauls to any engine or motor cycle; special department for Premier and Triumph pairs; work carried out by mechanics late with Triumph and Premier works. [9143

WHITE and Watson, 80, Belvedere Rd., London, S.E.1, Engineers.—We have again reduced our prices for cylinder regrinding. By careful organisation we have arranged a 24-hour service. Cylinders ground and fitted with new pistons complete in 24 hours from time of receipt to dispatch. To facilitate this it is advisable to post remittance and return carriage when dispatching according to our schedule below:

3½h.p., 3½h.p., and 4h.p. Douglas cylinders re-bored ground and fitted with 2 new pistons complete, 35/- 38/- and 40/- respectively. Other flat twins from 38/- to 40/- per pair. Other cylinders at the following rates: Up to 65mm. 22/6, 70mm. 27/6, 75mm. 30/-, 85mm. 34/-, and over 37/6; 2-strokes up to 70mm., 34/6. Knowing the difficulty motorcyclists have in getting reasonable price and good complete overhauls, we are prepared to overhaul machines at the following prices: 2¾h.p. Douglas, £6; 3½h.p. Douglas, £6/10; 3½h.p. and 4h.p. singles, £7/16; 8h.p. and 6h.p. twins, £7/16; 2¾h.p. single 2-strokes, £5/10; 2¾h.p. 2-strokes, £5. This overhaul to include regrinding cylinders, fitting new pistons complete, rebushing, refacing valves, overhauling gear box, testing and tuning. Machines can be collected and delivered within a 20 miles radius of London. Bring the old 'bus to us and we will return as new. Brico rings fitted to our rebores as standard. First-class workmanship. Aluminium welding, no distortion. Replacements machined. [7867

Spare Parts.

THERE is scarcely a week that we do not receive complaints from motor cyclists regarding the cost of replacement parts. Without doubt the majority of riders consider that the prices of spares are, and always have been, too high, and they express their disapproval of the present policy of the manufacturers in maintaining the prices of parts while reducing those of complete motor cycles.

Among car manufacturers it has become the rule to reduce all the prices of products of their factories (parts and complete machines) simultaneously.

The spare part problem has been with us ever since motor cycles have been produced, and since overseas goodwill depends so much upon it we are constrained to wonder why greater appreciation of its importance has not been shown by British manufacturers. The question of spare parts service abroad is one which calls for immediate and serious action in order to encourage the return of overseas sales which are so necessary for the future prosperity of the industry.

Pillion Riding.

WHILE we have never wholeheartedly agreed with the practice of pillion riding on solo machines, we cannot understand why the daily press should be so obviously biased concerning its dangers. We mention the daily press first because undoubtedly it has helped to shape the unreasonable prejudice displayed on the part of certain sections of the public.

Whenever there is an accident and a pillion passenger is involved, the practice is blamed; this was particularly noticeable at a recent inquest, where the Coroner made statements which had no foundation whatsoever in fact.

This outcry against a popular form of motor cycling is absurd, but nevertheless it must tend to cause harm to the motor cycle industry generally. It is a matter which the British Motor Cycle Manufacturers' Union should investigate, and while we do not suggest propaganda to make pillion riding more popular, there should be ways and means to remove the ignorance and prejudice of newspaper headline writers and those gentlemen whose duty at an inquest is to consider facts and not to comment on matters quite irrelevant to the case concerned.

It does not seem to be sufficiently well known that the Ministry of Transport has investigated the so-called dangers of pillion riding, and in a report issued this year implied that there was insufficient evidence to show that pillion riding was dangerous.

Unappreciated Club Officials.

THE club secretary is seldom valued at his true worth. Usually he is an unselfish enthusiast who toils long and hard in the interests of others. Virtue may be its own reward, and undoubtedly he gains much pleasure from the pleasure of others; but whether he desires it or not, he deserves greater recognition. He seldom gets it; indeed, too often his very existence is only recalled to revile him.

Often it is mere thoughtlessness. Motor cyclists in general and club men in particular rightly pride themselves on being good sportsmen. Let them retain this trait in their relations with their club officials as well as with their fellow members. Let them remember that in nine cases out of ten the secretary would infinitely prefer to be a competitor, but he recognises that somebody must take up the organising duties and being very keen he accepts the task himself.

An index to the advertisements in this issue will be found on the page facing the back cover.

The Three-speed Scott.

WHISPER it not in Coventry or Wolverhampton, but not the least of my Olympia anxieties is a haunting doubt whether the Scott people are really going to standardise their three-speed gear for 1923 or not. Admittedly, the Scott can fulfil all ordinary needs on a two-speed gear, as its competition record demonstrates. But the sports fraternity in general, not excluding, one hopes, us people of the pen, are set fearsome tasks by trials organisers nowadays. When Park Rash has to be climbed on a wet day one knows that over 90% of the travellers will be using bottom gears approaching 20 to 1; and it requires much audacity to join them on a bottom gear of 8 or thereabouts, and eke much skill to clamber up the shale precipices on such a ratio. Permanently lower gears imply some sacrifice of speed on those rare occasions when we get a real flutter over level tar. Changing gears once or twice a week is a nuisance. So I hope the three-speed Scott is really coming out at last; and if it does, the popular Yorkshire make should enjoy a record season in 1923. Many ardent Scott enthusiasts who are advancing in years will welcome a "go slow" bottom gear.

Thick Coats for Cold Weather.

SEVERAL riders wrote to me at the approach of the cold weather in quest of a rig which should be both rain and cold proof, like a good Sidcot suit. I have made enquiries amongst the firms who cater specifically for motor cyclists, and most of them take the very sensible line that the market for really heavy coats is too limited, since the ordinary rider prefers to utilise leather vests and the like to retain heat, adding a lightish jacket to keep out rain. The heaviest waterproof reefer I have yet encountered scales 6 lb., and is made by Irvine Smith, of Bradford, several other coats with lighter linings coming within a pound or so of it. I agree with the sporting tailors. One can get all the warmth that is possible from leather underwear and the like. Waterproofing should be added in the form of overalls; and the only difference which I make in overalls for June and overalls for December is that my summer rainproof jacket weighs 3½ lb. and my winter reefer 6 lb. This difference is not in itself enough to cope with the contrast in the two temperatures, but the heavier coat is more fully rainproof, and will serve—without other extra garments—for a brief run in winter, when I go out to dinner, or cards, or a club evening.

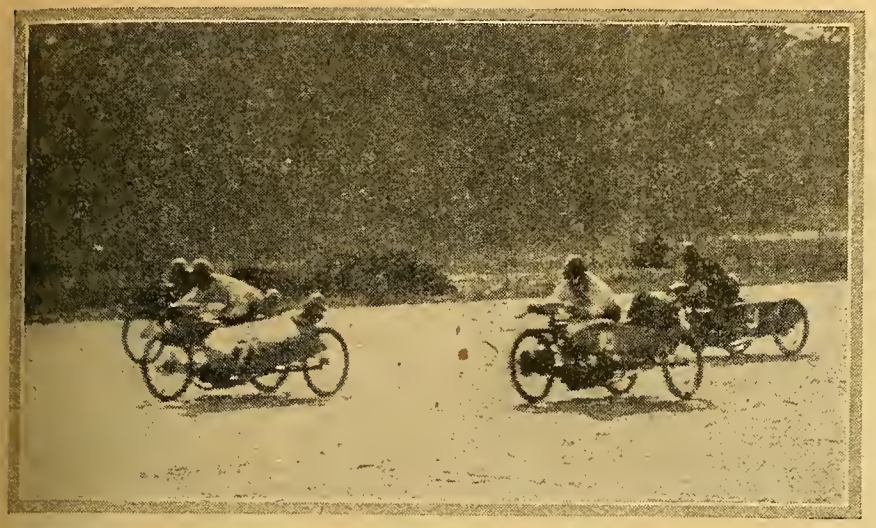
"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

Waterproof Gloves.

A BRITISH glove-making firm has asked for the loan of the worn-out imported waterproof gloves which I described on October 19th as the best article of the kind ever provided for motor cycle purposes. I have sent half the pair to the applicant. The other half is still at the service of any glove-making firm with the brains and capital to open up an empty and hungry market.

Disappointing Sports Models.

ONE or two complaints reach me every season from disgruntled owners of sports models, who have failed to secure the expected 60 or 70 m.p.h. Pity me. What can I do when a man writes and states that he has made every possible experiment and adjustment, but still only gets a beggarly 50 m.p.h.? Where the machine is the product of a reputable firm the proper course is to take the matter up with the factory concerned. I have never known this simple course to fail, as firms with a reputation for speed are very sensitive about their name in that respect. On the other hand, it is only fair to warn users that when excessive speeds are guaranteed from rather small engines, only a very clever owner will be able to maintain the speed. At the Brooklands



SIDECARS BATTLING FOR POSITION. In the Brooklands Championships. From left to right: P. S. Kennedy (496 Zenith-Bradshaw), L. F. Peaty (498 Hawker), T. Simister (490 Norton), and V. Horsman (490 Norton).

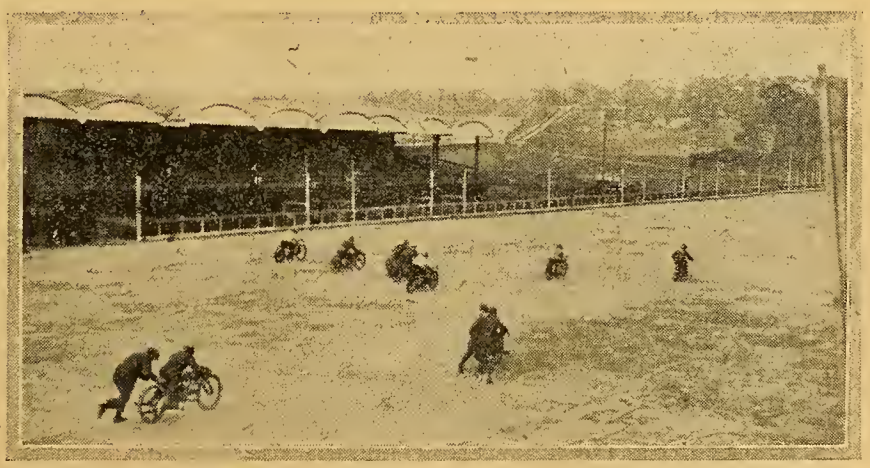
championships the other week ten started in the 750 c.c. event, and only two finished. The reason was that several of the entrants had already pushed the same machines hard in the 500 c.c. event. So the man who buys a 350 c.c. to do 70 m.p.h. must be content if he can get his 70 m.p.h. for the first week. Whether he can still get it in the second week, or, indeed, whether he will have much engine left at the end of three months depends entirely upon himself. If a 500 c.c. sports model will touch a mile a minute at any time through the season in the hands of a tolerably clever owner, he has had what one might fairly call an honest deal; such a speed is more than any smaller engine can reasonably be expected to produce on demand without semi-professional maintenance.

The Ultra-Lightweight.

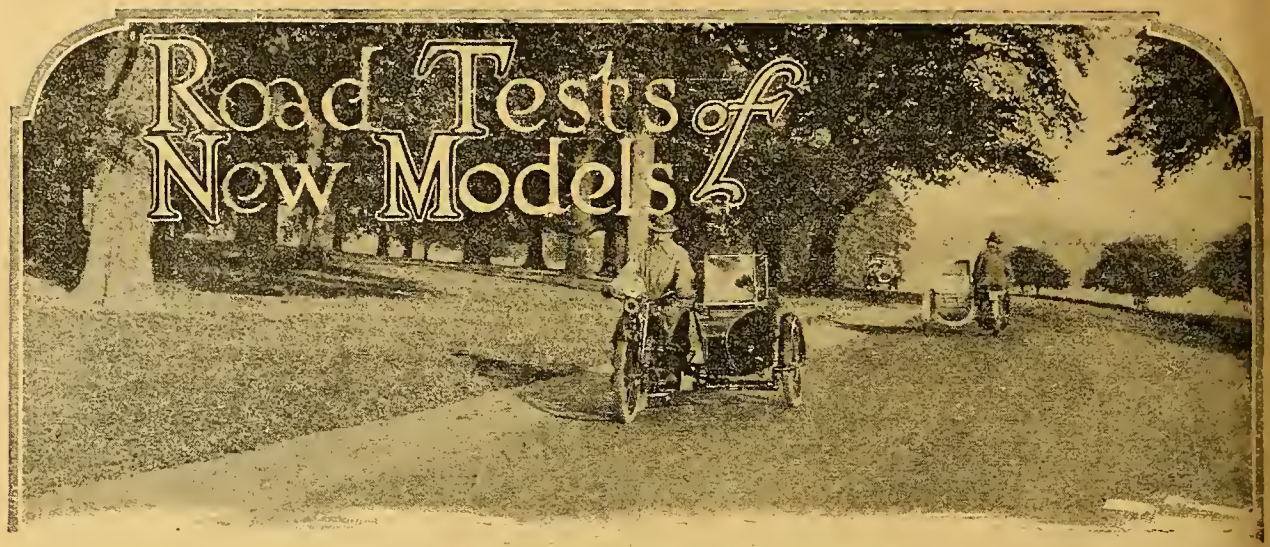
LIKE many other people, I am watching with intense interest the sudden revival of the ultra-lightweight motor bicycle. There are tendencies to strangle it at birth in some quarters, but the grounds are not logical. Quite obviously it does not fulfil all needs, and in its present versions it will not satisfy Elderly Auntie, who cannot afford a car, is too pursy to pedal a tricycle, and lives several miles from the shops and her afternoon tea circle. Auntie cannot mend punctures or shorten a belt, and her roads are hilly. But the single-geared lightweight with tyres which must be repaired there and then if a puncture occurs is not to be ruled off the road because it won't suit Auntie any better than a scooter did. In the early morning and towards 5 p.m. thousands of miles of British road are covered by impecunious cyclists, who loathe pedalling, and some of them have quite a few pounds in the bank. These men are quite capable of looking after a belt, or even an engine; 2in. tyres would not puncture too often under a gross load of perhaps 120 lb. per wheel. The objections to pedalling would not extend to a few turns up occasional hills. Then this country contains a vast horde of canvassers, who daily pedal over long rounds taking orders for fish and meat and groceries and insurance and what not. I believe there may be a really excellent market for a 100 lb. ultra-lightweight on two conditions. First, it must be genuinely cheap. Second, its quality in materials and workmanship must be just about as high as that of the most posh £100 machine. Those two factors being conceded, roadside stops with non-essentials and a deficiency from our normal standard of climbing power might prove comparatively unimportant. Auntie must wait for something much more elaborate, *e.g.*, a cheaper edition of the Harper.

Real Sports.

HEIGHO! If I could be twenty again and A1, I would dodge the Geddes axe somehow, and worm my way into H.M. Navy. I have met many full-blooded motor cycling enthusiasts, but I award the palm to those young officers who pay a callous Government tax for the full year, and get their legs over the saddle about once in a twelvemonth. Such a merry youth takes me gently to task for using the 16in. turret as the apotheosis of noise. Apparently it is where the Admiral resorts for a nap during gun practice, it being impossible to tell when the gun has fired but for its stealthy motion aft on the recoil. His brother officers run a small road club, which organises trips when in port at a speed with which I shall not sully this page. The writer's four-valve Triumph is the despair of the mess, but two A.B.C.'s and a 1921 Sunbeam do their best to keep up.



ACCELERATION. Well away at the start means quite a useful gain, even in a five-lap race. Start of the 500 c.c. event at the last Brooklands meeting.



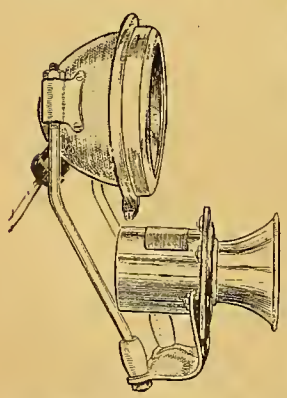
The 989 c.c. Harley-Davidson Sidecar.

SPECIFICATION.

ENGINE: 84·1 × 88·9 (989 c.c.).	*CARBURETTER: Schebler.*	*GEAR BOX: Three-speed.*
IGNITION: Remy dynamo lighting and ignition.	*TRANSMISSION: Chain.*	*PRICE: £147 10s. Solo. £175 with Sidecar.*
	WEIGHT: 330 lb.	

ONE of the things the novice cannot understand is the joy of the sense of power. He reads that a 350 c.c. machine will take a sidecar at 20 m.p.h. anywhere within reason; he thinks that as he will never exceed the legal limit he will have all the power he needs.

Power gives the greatest zest to riding, but only if it is used discreetly. In driving the 989 c.c. Harley-Davidson sidecar there is power and to spare; it is not often needed all at once, but it is there when it is. The speed on the level and uphill are all that can be wished for, and, what is just as important, the Harley-Davidson is as pleasant to drive in narrow winding lanes as when swallowing miles on the open highway. It has an excellent clutch, and if this is allowed to slip just the least shade there is absolutely no snatch, and the engine runs at a mere tick-over as smoothly as can be desired.



Head lamp and electric horn are supported on the same bracket and a quickly detachable lamp glass is fitted.

Engine Flexibility.

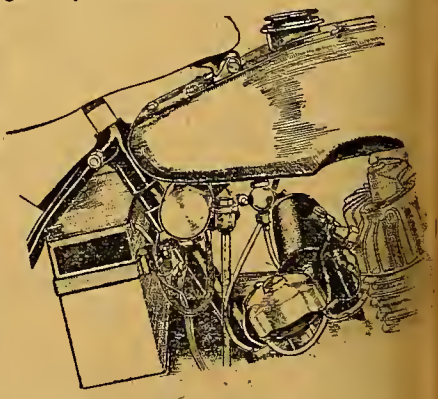
Much of this flexibility is due to the carburetter, and our American cousins have shown their wisdom in supplying and fitting to their motor cycles a carburetter which will give even firing at slow speeds, is controlled by one lever, and yet is capable of adjustment to suit varying atmospheric conditions.

Forks and saddle give as much comfort as if the frame were sprung; the steering is excellent, and the acceleration is also very fine. Both brakes possess immense power, and either will stop the machine with equal efficiency. The two brake pedals are on the off side, one being actuated by the toe, the other by the heel.

Top-gear Capabilities.

Used in narrow country lanes, in dense traffic, on good main roads and by night as well as day, the outfit acquitted itself remarkably well. Changes of gear were seldom necessary, and when they were second nearly always sufficed. Low gear is in the nature of an emergency ratio.

Driving by night anywhere near London is none too pleasant nowadays, as there is a great deal of lorry traffic and many cars with blazing head lamps; but it loses much of its terrors thanks to the Harley's excellent electric equipment. By means of the little switch placed just where the



Electrical equipment and distributer which shields the H.T. wires from rain. The disposition of the fuse box and accumulators is also shown.

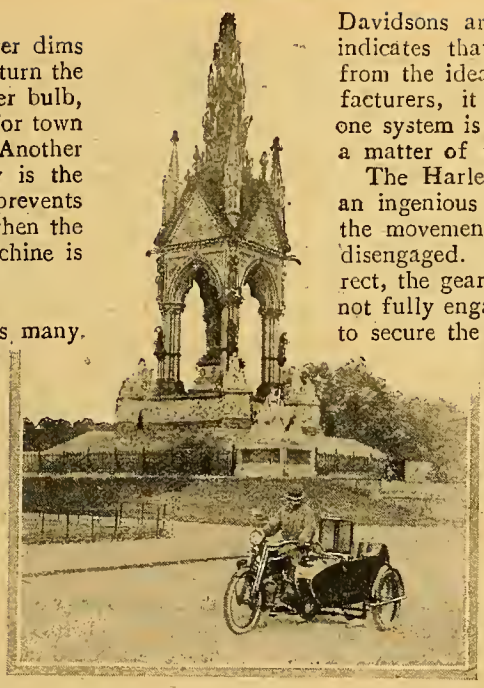
Road Tests of New Models.—

cable enters the lamp, if a car driver dims his lamps, the Harley driver can return the courtesy by switching on the dimmer bulb, which also gives just enough light for town driving and is quite useful in fog. Another good feature of the latest Harley is the automatic charging switch which prevents the discharge of the accumulator when the engine is running slowly or the machine is at rest.

Unfamiliar Controls.

It is difficult for one who drives many different makes of motor cycles to criticise the methods of control, for any system is easy when one is used to it. For this reason no criticism of the twist grip throttle control is made, for habitual riders of American machines appreciate it to the full.

On one point of the control mechanism we may comment, however; frankly, we do not like the method of controlling the clutch. Its hand lever is not convenient and its pedal is of the rocking variety, the movement of which neither blends with the twisting of the handle-bar grip nor agrees with the natural push forward action of the brake pedal. It is not natural to stamp on the brake pedal with the right foot and employ a totally different movement with the left; the hand clutch control would be infinitely preferable if it were a simply pull-up lever on the handle-bar and not a lever placed somewhere beneath the left thigh at the side of the machine.



One of London's roads to the West Country with the Albert Memorial in the back ground.

Requires Learning.

One who has become accustomed to foot operation of the clutch or to the handle-bar lever finds the alternative disconcerting at first. The same remark applies to twist grip throttle control, but the dexterous manner with which Harley-Davidsons are handled, both solo and sidecar, indicates that, while the controls are different from the ideas of the majority of British manufacturers, it does not necessarily follow that one system is superior to the other. It is merely a matter of what one is accustomed to use.

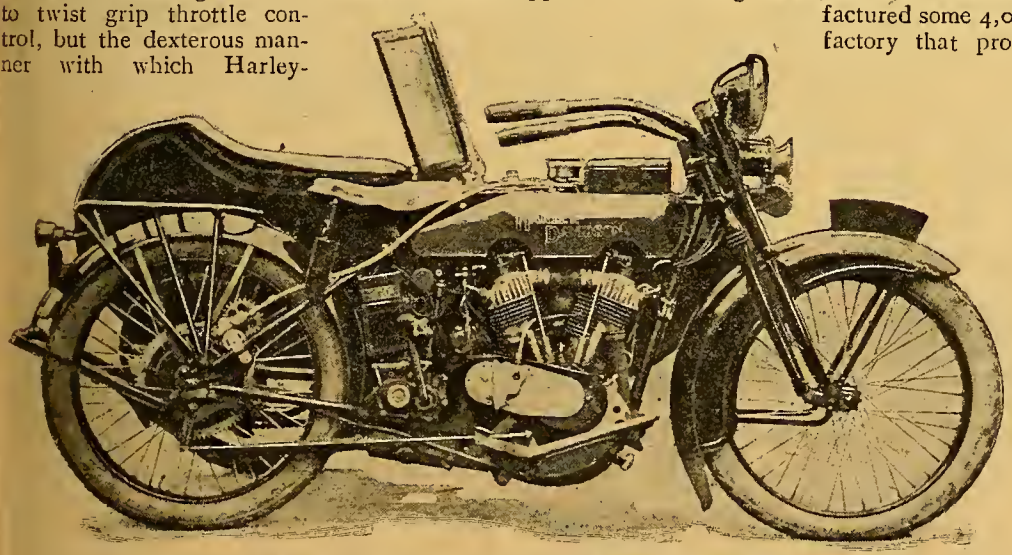
The Harley, like other American makes, has an ingenious interlocking device which prevents the movement of the gears unless the clutch is disengaged. Should the adjustment be incorrect, the gear can be changed, but the clutch will not fully engage. It would be no great difficulty to secure the correct adjustment were the necessary spanners supplied, but the tool-kit is inadequate. This is a small item, but one which the makers could easily rectify.

Apart from these details, the Harley-Davidson sidecar outfit is a splendid machine. Besides the flexibility and power of the engine, its steering is excellent; and, provided the clutch is judiciously used when travelling slowly, smooth running can be obtained throughout a wide range of speed.

Our general impression of the outfit was distinctly favourable. Its power and acceleration are superior to many machines of similar price or capacity, and it must particularly appeal to the sporting rider. In fact, it is one of the first favourites with that fraternity, although as sold it is essentially a comfortable touring outfit.

Attractive Bodywork.

The sidecar itself manages to combine a reasonably symmetrical appearance with ample roominess—not at all so common an attainment as one might imagine. Finished in the same rich shade of olive-green as the machine, it forms a very attractive-looking whole, which gives no indication that the attachment is manufactured some 4,000 miles away from the factory that produced the cycle.

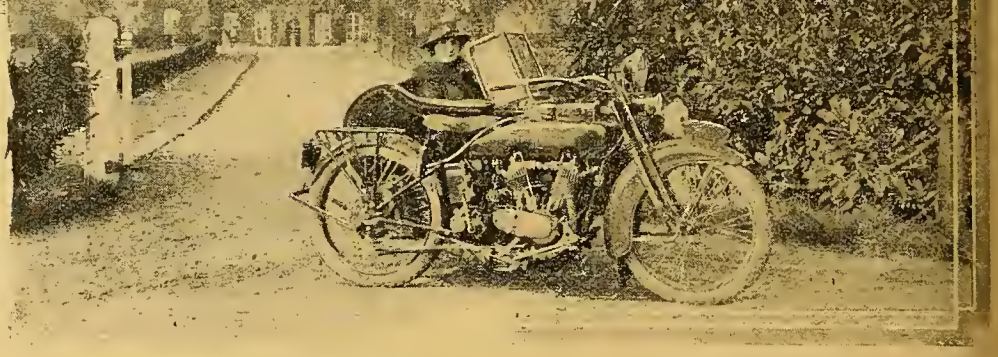


Typical of the best American motor cycle practice, the 989 c.c. electrically equipped Harley-Davidson sidecar outfit.

This year the Harley - Davidson has been exceptionally successful on the road in this country and also on the Continent. Four gold medals were won in the A.C.U. Six Days Trials with an entry of four riders, three of whom tied for the team prize; one special gold medal in the International Six Days Trials, and two ordinary gold medals; while many successes have been gained in Italy.

Passenger Machine Topics

By FRIAR JOHN



The Small Car Bogey; Exit of the big Sidecar not in sight; Sidecar Manufacturers' Experiments and the Lessons Learned

THE old topic, sidecar *versus* three-wheeler, runabout, or what you will is ever cropping up. Of course, the ardent Morganite and his like know no compassion on delivery of his spick-and-span runabout; his old love is forgotten, and cast off with the relief one casts off winter clothing—but usually he is at heart a motor cyclist, and we still embrace the runabout man, for he has not departed from the fold completely.

We will not take the question of protection, however: we will concede that one big drawback of the sidecar.

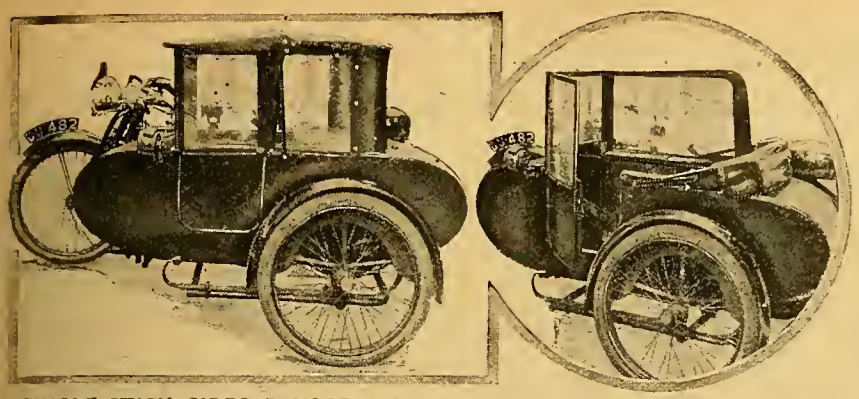
The man I would break a lance with is he who predicts that a little car of orthodox appearance and silent—let us repeat that—of orthodox appearance and silent, will soon be produced as cheaply as a sidecar outfit, and eventually drive the latter off the road.

Now for the first thing I would like to know *why* the four-wheeler runabout or little car is likely to be produced cheaper in future and at the same time sidecar prices are to remain unaltered; for that is what will have to happen for the prices of both to become level in this wonderful future. Unless some great firm with millions behind it turns a little car out in the sausage machine manner, this cannot happen; and if it did it would go smash in six months, for we could never absorb sufficient of its products in this country to make that firm pay its way. It could never be a world-wide proposition like the wonderful Ford.

Shall we ever see sidecars hurtling round the bends of the "T.T." course in this manner? An extraordinary impression taken on the dirt track at Mansfield, Ohio, U.S.A., exemplifying the use of the flexible sidecar.

THE production of this phantom car has to be considered in conjunction with the production methods at present in vogue, and not by methods we would like firms to adopt. It is not likely then that the production methods for little cars will ever differ fundamentally from those adopted by sidecar manufacturers, so that it obviously follows that this price gap must always exist. Granted, it will grow proportionately less as prices lower, but everything up to the present has proved—manufacturers' costs sheets and balance sheets—that a car cannot, no matter how simply made, ever compete in price with the powerful sidecar.

TEN years ago I thought the cycle car would eventually usurp the place of the powerful sidecar. But the calm stream of sidecar progress was not even ruffled in those experimental days. In 1918 again, I fancied the sidecar was being over-developed, and would give way to some other type of vehicle, probably the simple three-wheeler. Again, this year, when the prices of



SINGLE STICK SIDECAR HOOD. This neat and simple hood has been devised by Mr. J. P. Thomas, of 40, Kingsland Avenue, Coventry. Made of blue twill, it can be erected or lowered in a few seconds and is mounted on one hood stick per side, the front of the hood locking to the top of the wind screen. Celluloid side screens are fitted, and, after detaching one side screen only, the hood can be instantly lowered with the remainder of the side curtains in position.

several small cars made by big manufacturers were announced, I asked, with others, whether this new competition would mean the exit of the well proved family sidecar, the vehicle which willingly fulfils the purpose of a small four-seater car, and takes the entire family out without a murmur, at half the cost. The answer in actual practice is that an inevitable price gap must always exist, *if the quality of both vehicles be comparable*. That alone is sufficient to maintain for the powerful sidecar its popular place among motor vehicles of to-day.

◈ ◈ ◈ ◈

PROFITS from big sidecars may not have swollen dividends much this year, as much even as was desired and expected, but possibly that may be accounted for. Remember, the man who buys a family sidecar is not usually wealthy, and looks further ahead than the youth who buys a sporting model or a two-stroke. Many men hesitated to buy this year because they knew that horrible phantom depreciation would be stalking abroad if prices tumbled to an unprecedented depth. But youth cares little about that—he usually ignores second-hand values. Next year depreciation may be much nearer normal, and the family man who hesitated to buy this year may place his order for a next year's model with reasonable security. I do not think for a moment that the moderate trade done this year in heavy sidecars was due to any waning popularity, but, as I have suggested, to the ca' canny policy of the family man who counted his pennies twice before spending.

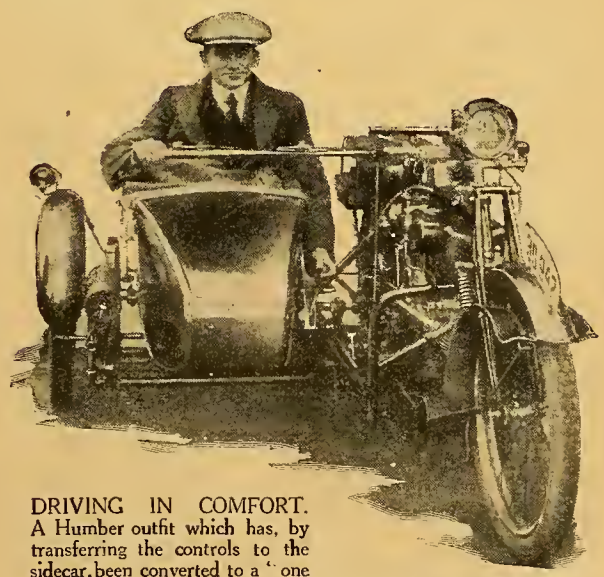
◈ ◈ ◈ ◈

RECENT experiments, too, which have been carried out by many manufacturers of big sidecars, have not, to my knowledge, produced a satisfactory four-wheeled vehicle marketable at the price of their outfits. The Carden, A.V., and Tamplin stand in a class quite apart and in a class which will surely grow. The G.N. is abandoning chain drive for shaft, maintaining its prices, and also introducing a water-cooled four-seater. The Coventry-Premier, starting out as a three-wheeled twin-cylinder, has now developed into a four-cylinder car proper at a small car price. All these happenings point to one thing, and that is, inability to make a quality vehicle following car practice on four wheels at the price of a sidecar. The Shows may reveal something astonishing, but I shall be amazed to find four-wheel cars as *refined in detail as the best outfits offered at equivalent prices*.

◈ ◈ ◈ ◈

I HAVE heard astonishingly few adverse opinions on the holding of a sidecar T.T. Nearly everyone is of the idea that the race will ultimately benefit sidecar design. It may. But I shall be surprised if the lessons learned will help very greatly in improving the rigid touring type chassis, for, in all probability, competitors will turn to the flexible chassis. Sidecar connections, the chassis itself, sidecar wheel bearings and spindle, the forks and front wheel spindle of the machine will be tested to the utmost on the abrupt bends, and weaknesses will most certainly be revealed before many laps are covered. It goes without saying, too, that engines, gear boxes, and transmissions will be subjected to strains that they have never yet undergone, and that is saying a good deal. Brooklands tells us a lot, so does the "Six Days," but up to now there has been no opportunity of running an outfit at the speed of 50 m.p.h. uphill and down, round acute bends and over humped-backed bridges for hours on end, and that is why the Isle of Man course will reveal more weaknesses than track racing ever does. It will be a nightmare ride for many.

On the question of danger, I am emphatically with Mr. Norton, and many other experienced racing motor cyclists, including F. W. Barnes, T. C. de la Hay, and J. E. Greenwood, who agree that the greatest restraint will have to be exercised, and that none but the most skilful and capable should be allowed to compete.

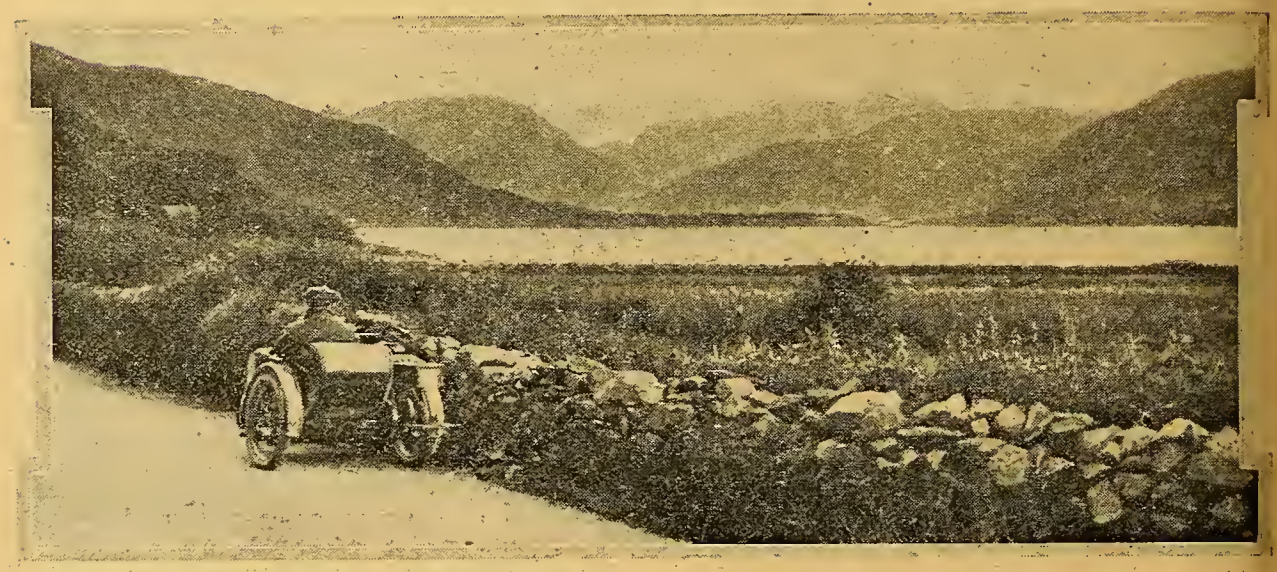


DRIVING IN COMFORT. A Humber outfit which has, by transferring the controls to the sidecar, been converted to a "one man" three-wheeler. Tiller steering replaces the handle-bars.

A FAMOUS FERRY DOOMED.

Good News for the Motor Cycle Tourist in the West of Scotland.

By E. M. WRIGHT.



Loch Leven from the north side, looking south-east. Glencoe goes through the heart of the magnificent mountains in the background, which are all from 3,300 to 3,700 feet high.

THE English tourist who knows his Scotland wisely lays aside a certain substantial sum for ferry charges whenever he crosses the Border. Particularly does he do so when he is including the magnificent north-west coast, without visiting which no tour in Scotland is complete.

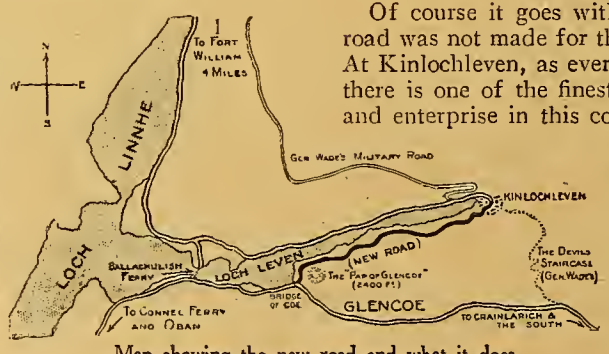
Scotland would not be Scotland without its piled-up mountain ranges, which make roads scare, and its long fingers, stretching inland, of sea, loch or wide estuary, which make ferries numerous.

Unavoidable.

Of all those ferries, perhaps the one most universally known is that at Ballachulish. I hear someone murmur "Queensferry." But a glance at the map will show that Ballachulish, though serving much less populous districts, lies at a bottle neck which cannot be avoided unless the traveller goes away miles inland to another part of the country altogether. The next road north and south is some 80 miles to the east—the Great North Road itself.

Ballachulish ferry itself spans Loch Leven at a point where it is only a couple of hundred yards or so in width, and the charges are out of all proportion to the actual work done for them. (Of course the same holds true of most ferries where motor traffic is concerned!)

Disregarding for the moment the tourist from other countries, consider the motor cyclist from Glasgow and the west of Scotland. To him Fort William and the glens around should be one of the finest fields for a week-end tour. But the distance by road alone is prohibitive, taking him round by Aberfeldy to Newtonmore and down to Spean Bridge, practically three sides of a square. On the other hand the Ballachulish ferry charges for a sidecar machine (10s. odd for the passage out and home) add far too much to the cost of such an economical week-end as the sidecar machine can provide for one or more persons. It discourages the ordinary tourist.



Map showing the new road and what it does.

Hence the importance to all classes of motor cyclists of the new road which has just been completed between Bridge of Coe and Kinlochleven. As our map shows, this connects the main road from Glasgow and the South to the existing road on the north of Loch Leven. Thus by a detour of not more than ten miles or so the traveller can make Fort William without crossing the ferry.

At Kinlochleven.

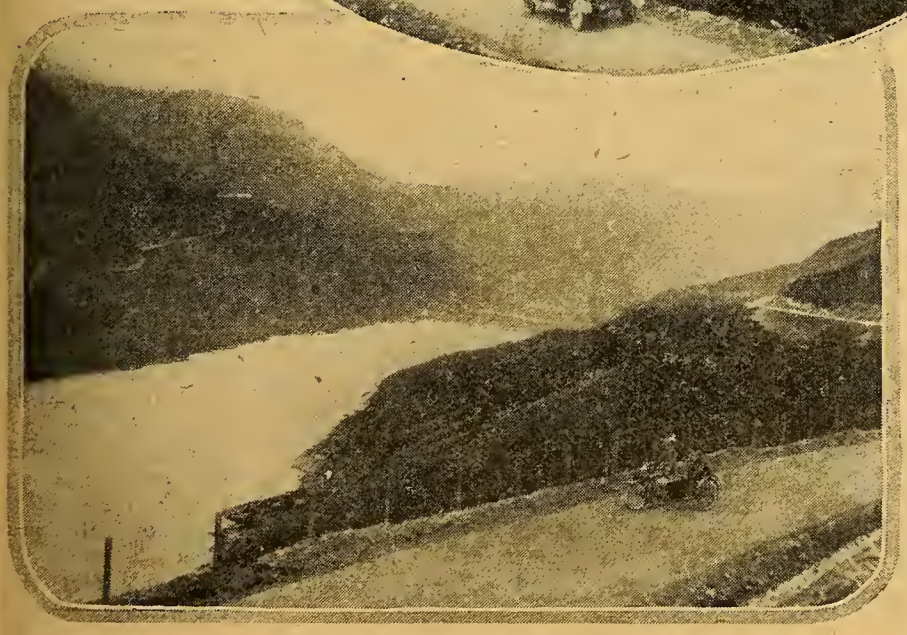
Of course it goes without saying that this fine new road was not made for the convenience of the motorist. At Kinlochleven, as every good Britisher should know, there is one of the finest examples of British industry and enterprise in this country, namely, the great aluminium works of the British Aluminium Co., Ltd., laid down twenty years ago. These works make use of the tremendous store of water lying at great heights (from 1,000 to 1,800 ft.) in the hollows of the mountains to the east.

A Famous Ferry Doomed.— Hitherto access to Kinlochleven has been practically entirely by water, as small steamers can get right up the loch to the village. Such strides have been made in recent years, however, particularly during the war, that Kinlochleven is now a fine modern township of about 2,500 souls, boasting electric light in all its delightful little modern houses and its quaint little streets.

It was to connect this industrial community with the Argyllshire road system that the new road was started during the war. The labour at first employed was that of conscientious objectors. Then German prisoners were concentrated here and performed yeoman service with true Hun thoroughness. Since the war the road has been slowly completed by the usual civilian labour.

Loch Leven looking inland from Ballachulish. In the left centre the long arm of the loch is seen stretching away up into the mountains round Kinlochleven.

The new road looking towards Ballachulish. This view was taken half-way between Kinlochleven and Bridge of Coe, and shows the "Pap of Glencoe."



On the new road looking east about a mile out of Kinlochleven. General Wade's road to Fort William can be seen on the opposite side of the loch.

It is a platitude to say that fresh road development is urgently needed in this part of the country; for is it not so all over Scotland?

Our map shows that there is a sort of path or pack-horse track leading from the eastern entrance of Glencoe over the shoulder of the mountains to Kinlochleven. This was General Wade's original road, and it would be no great task to reconstruct it.

Then on the north side of Loch Leven the present road from Kinlochleven to North Ballachulish is very narrow and full of blind corners and dangerous portions. For a large car with a high top is quite out of the question, as in places the rock through which it is cut converges at the top almost like a tunnel, and a very low one at that.

Across Burmese Hills and Vales

With a Motor Cycle in the Shan States. Fine Scenery but Limited Number of Roads.

By ULRIC NISBET.

MOTOR cycling in the Shan States of Burma requires first and foremost a reliable machine, and secondly an optimistic outlook on life. These are essential, as repair shops are few and far between, and sooner or later one's optimism is likely to be tested under all sorts of conditions. But if one is prepared to brave everything, there is no country in the world more beautiful or more suitable for testing the power and reliability of one's motor cycle.

Just over 300 miles north of Rangoon on the main line to Mandalay there lies the little town of Thazi. Burma is so far behind the times that there is as yet no road constructed to carry motor traffic up to Thazi and Mandalay. It is necessary, therefore, to take the train from Rangoon to Thazi (a fifteen-hour crawl by the night mail), whence the road may be followed up to Kalaw, hidden far beyond the distant hills; but perhaps it is more advisable to go up by the little branch line train. It is a long journey—six hours to cover sixty miles—but the magnificence of the hills up to which it climbs and the wonderful and ever-changing panorama compensates fully for the apparent waste of time.

4,300 Feet Up.

Kalaw lies in an open valley, 4,300 feet above sea level. All round the hills rise thickly wooded so that it seems that there is no way through them. During the last few years, however, the road has been opened up over 100 miles beyond; and this road, though by no means perfect, is quite good enough for the needs of the not over particular motorist or motor cyclist. Kalaw village itself is just a collection of tin-roofed huts, and amongst these there are some twenty small ruined pagodas which present a quaint but most dilapidated appearance. Though it is considered a worthy accomplishment to build a pagoda to Buddha's memory, no kudos would be attached to the man who repaired one already standing. In consequence, Burma is full of these bell-shaped shrines in all stages of decay.

There are dusty roads in all parts of the world, but this one must surely hold its place with any; and in five miles motor cycle and rider are covered with a thick coating, so that the make of machine and the number are absolutely unrecognisable. As policemen are conspicuous by their absence, this need not worry anyone, however.

Like Devon.

Outside the village the road at first passes along a valley shut in on either side by high hills. The ground is laid out in gardens and in small terraces for paddy growing. Trees line the way, and the scenery is very similar to that of Devon, for the soil has a reddish tinge. Loi-An is the next place through which one passes. A mine shaft has been sunk in the hillside overlooking the village, by no means adding to the beauty of the scene. Just above the road at the base of a steep wooded hill are two enormous white "chinthes" or dragons—the mythical creatures of Burma; from them rough steps are cut up the slopes of the hill to a "phoongyichoung" (monastery).

Eight miles from Kalaw lies the village of Aungban, a rather picturesque collection of rush-roofed huts on the bare hillside. The scenery here begins to change. The hills become bare of trees, and beyond the next rise is a vast stretch of open country with the road winding and switchbacking along into the distance. Far away on each side rocky hills rise up in all shades of brown, fading to blue. Dotted about on the peaks are many little white pagodas which catch the light of the sun, and here and there small columns of smoke rise up, though there is no sign of life near them.

The sleeping drivers of bullock teams do not heed motor cycle horns.

On his first visit the writer came to an obstruction placed across the road at this

Across Burmese Hills and Vales.—

point. The bridge spanning a stream had collapsed, and a native pointed to a cart track, leading off from the main road. This proved to be a bumpy passage, with deep thick dust before it led up on the road again. Ascending again still more steeply the summit is reached, and beyond lies a scene of wonderful beauty—the Heho Valley.

A Common Obstruction.

Away in the distance and on each side range beyond range of hills towers up, and far below lies a great plain at a rough estimate fifteen miles long and five wide.

This plain is in parts dotted with small bushy trees from which little pagodas peep out, but for the most part it is bare of vegetation, and the descent down the twisting road is lined with great black boulders, and there are two hairpin bends which require careful negotiation, for the dust is thick and there are many stones to be avoided. The road along this vast plain is open, and time can be made up. There is, however, one trap which is always to be met with, even on the best roads of Burma—the bullock cart. When attempting to pass this type of vehicle it is as well to reduce speed to its lowest.

Over the plain brings the traveller into Heho village, which is the terminus of the Southern Shan States Railway. Here, if necessary, it is possible to replenish with petrol and oil at one of the three or four small shops which the village boasts.

Beyond Heho is a gentle slope of two miles, leading over into the Valley of Sinhe, which is covered with small bushy trees, pretty orchards, and, here and there, stretches of open country quite bare of vegetation. In front, fully twelve miles away, a wonderful range of wooded hills rises up, and beyond that more ranges and high peaks. Far away on the right a sheet of water flashes in the sunlight, the famous Inhle Lake.

A snake across the path is frequently encountered.

Caution Required.

The descent requires much care, for it seems to be all corners, hairpins, and S and Z bends, thick with dust and stones. The valley once reached, the view is obscured by the jungles which line the road, and a snake across the path is frequently encountered. The road opens out once more, however, and runs dead straight across the valley for several miles. On this road there are many bullock carts, the drivers of which sleep soundly; they take no notice of our hooting. Sometimes a bevy of laughing girls goes by—a vision of brilliant silks and gay sunshades. On the right a road runs off parallel to the line of hills. This leads to Yaunghwe, called "the beautiful" by the writer, who spent a few delightful hours there once; called, alas! something very different by those who are compelled to live amongst its myriad mosquitoes. From Yaunghwe a native boat may be obtained with the Sawbwa's (Shan Chief's) permission, and an hour's poling along the old canal will bring one to the Inhle Lake, a very fine sheet of water in the midst of which a bungalow is built on piles.

Hill-climbing Difficulties.

Away to the left the country is famous for its oranges, and two miles from the main road lies the White Crow Lake, constructed by the Sawbwa on the spot where a white crow, now in his possession, was found. Straight ahead more climbing is encountered, but a speedy start is of no avail, for the ascent is scarcely begun before a Z bend has to be tackled, and so it continues, the only difference being that some of the bends are more outrageous than others. Often the road surface is uneven, the dust lies thick at the turns, and odd boulders are to be met. Meanwhile, on one side the hill drops sheer down; a night climb up this hill would provide a real thrill even for the most experienced rider.

From the summit there is a magnificent view over miles and miles of hills and plains, villages and jungles, as far as the eye can see; and another two miles further is the village of Taunggyi, 4,675 feet above the sea. Taunggyi is a very delightful spot with its little lake in which are reflected the grass-roofed huts and the hills which tower up behind.

An attempt to fill up with petrol here is likely to be frustrated, as the Chinese agent refuses to part with less than two gallons at a time. In vain to point out that one gallon is as much as the tank will hold; he is adamant, and unperturbed by one's candid opinion.

Feminine Fashions.

The Shan people met on the road are mostly women, dressed in dark blue trousers and loose-fitting smocks of the same colour. Some wear five or six silver rings just below their knees, possibly as a mark of respectability.

At Heho and such places one naturally makes for the dak bungalow (the rest house for Europeans in nearly all the larger villages), and an aged darwän provides a welcome cup of tea. Sugar is brought in an English newspaper anything up to two years old, which nevertheless proves interesting reading, for even the possession of a motor cycle with all its convenience as a time-saver does not give the feeling that one is still closely in touch with "home" in this secluded country.

OBTAINING SLOW RUNNING.

Adjusting Carburetter Controls to Gain Comfort and Tractability.

By H. MORTIMER BATTEN.

MANY riders do not appear to realise how much can be added to the comfort and tractability of a machine by devoting a little time to the adjustment of the carburetter controls. Seldom is a new machine delivered which is perfect in this respect, for the tastes of riders vary so much that it would not be worth the while of the factory tester to devote the time and pains necessary for that exact nicety of adjustment which seems to me so desirable. Moreover, it needs to be done after the initial stretching of the wires.

Friends' machines which I have borrowed are usually hopeless as regards delicacy of adjustment, while it is rarely that one hears a machine on the road which will throttle down to that slow tick which a little skill on the rider's part can obtain.

"Tick-Over" Desirable.

As already stated, tastes vary; but the usual and, in my opinion, the most comfortable way to set the controls is so that the engine ticks at its very slowest, but does not actually stop, with both the air and the throttle fully retarded. When waiting in traffic, both levers are moved back to the dead stop position, and even though the engine cannot be heard, one knows that it is turning over at a safe and proper speed. There is no need for those obnoxious and violent accelerations to which many riders subject their engines when thus held up, indicating that they have no tick-over position, and must run the engine pretty well red-hot to make sure that it is going.

With proper adjustment a machine should run with perfect economy in traffic, keeping as cool—indeed, often cooler—than on a country road. Turning idly over on the right mixture a present-day engine should never overheat, even though left running for hours, and it will use a negligible amount of petrol. If, on the other hand, the engine is alternately raced and almost stopped, up goes the petrol and oil consumption to an astounding point, and naturally the engine suffers by such treatment.

In order to get this nicety of control it is in the first place necessary to make sure that there are no leaks in the induction system. It is assumed, of course, that otherwise the unit is sound and gas-tight.

The safest plan to adopt is to presume that the induction system is a mass of leaks. Heat up the engine, remove the carburetter from the cylinder, smear the inside of the socket and also the cylinder stump which receives it with Seccotine, gold-size, or a good proprietary jointing paste. Use plenty of the stuff so that it is squeezed into and seals the saw-cuts which permit the tightening of the pipe, and, having refitted the carburetter and pulled it tightly up, give the outside of the joint another doping to fill up external cracks, then leave it for a little while to set. Subsequently test for leaks by dripping oil over the joint with the engine running slowly, the disappearance of the oil at once indicating a leak. A little insulation tape if necessary will make things sure.

Now, with ignition fully advanced, move the carburetter levers till the desired tick-over is obtained—slow but sure. Note that there is no black smoke from the exhaust, as this indicates too rich a mixture, and when the engine is really hot it will be very much too rich. The "tick-over" mixture should, therefore, be as weak as the engine will accept when practically cold; and when the ignition is suddenly retarded the running should be so slow that the engine is likely to stop at any gasp.

Having attained this desired point, leave the controls where they are, and stop the engine by lifting the exhaust. Remove the gauze from the air intake, and mark the exact positions of the petrol and air slides by scratching the brass with the point of a knife (alternatively they can be propped so as to retain their positions). With this guide move both handle-bar levers to the closed positions, then adjust the cables by the provision made till the wires are taut with the slides in their marked places. Thus the slow running point, to which you can return positively at any time, is definitely fixed, and all "groping in the dark" is avoided. With an injection of petrol the engine should start at this setting, or at any rate with the throttle slightly opened.

Attention to Petrol Level.

Just as riders have individual tastes, so have engines. Carburetters are turned out with a fixed setting, and are seldom altered by the makers who fit them. Thus it often happens that a certain engine will profit in every way by a slightly lower petrol level—it is seldom safe to raise the petrol level. In testing for the slow running point, if it is found that the engine stutters and becomes uncertain ere the revolutions are as low as they might be, it may be due to (1) air leak round the inlet valve or elsewhere, or (2)—more commonly—unsuitable petrol level. It is generally possible to adjust the petrol level without losing the original setting, for it may probably be lowered by fitting a fibre washer under the collar on the needle, and the experiment is worth trying when testing for extreme slow running.

All these experiments are to be commended in that they help very considerably to make the rider *au fait* with his engine, for if he never tries to improve it, certain it is that it will deteriorate steadily, and he will, sooner or later, have to foot the bill in the way of depreciation.

The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4., and must be accompanied by the writer's name and address.

HIDDEN PRICE LISTS.

Sir,—Why do not the various manufacturers of fuels and oils insist that their price lists be displayed in a *prominent* place by their stockists? "REAL SCOTCH."
West Calder.

SILENCE.

Sir,—Undoubtedly, we have to thank a minority of drain-pipe merchants for the unwelcome police attention of the moment; it is surely up to the more reasonable majority to put our house in order, *before it is done for us.*

Is it not possible, with the co-operation of the motor press, to convince the few that untimely and unseemly noise is the worst possible advertisement for the sport, comes under the general heading of bad form, and that "it is not done in the best circles"? TWENTY YEARS' RIDER.
Retford.

INFALLIBLE SPEED LIMITS.

Sir,—As a frequenter of Sutton, Surrey, I was interested to read of the suggestion of "hummocked surfaces" to reduce the speed of motors there. I wonder if it has occurred to the Sutton authorities that riding over 9in. undulations is likely to break things, and that, in the event of this happening, claims will probably be made on them. This suggestion is the result of three fatal accidents in a week, and in every case, I understand, a lorry was the offender. Now lorries will not be greatly affected by undulations, but motor cycles and cars will be very much shaken about and springs, etc., may easily break. N. E. HEARD.

STILL LESS EASY PAYMENTS.

Sir,—"Shylock" quotes the case of the motor cyclist being charged 17% for easy payments. A firm recently gave me the following quotation for a pedal cycle:

Cash Price	£13	9	6
Deposit	£1	7	5
12 payments of (monthly) ...	£1	7	5

Thus, you pay back in instalments £16 9s. Taking deposit from cash price, you pay back £3 16s. 11d. for the loan of £12 2s. 1d., which gives, roughly, 36%. The motor cyclist is apparently not hard done by. ZENITH.
London, S.W.1.

THOUGHTLESS LADY MOTORISTS.

Sir,—I was glad to read your correspondent's letter on "Thoughtless Lady Motorists," which I can confirm from experience.

Your heading is a correct one, for I would suggest that the cause is rarely intentional discourtesy. The fair sex, as pedestrians, have been so accustomed for generations to men giving way to them on the roads and footpaths that they forget they cannot expect the same privileges when they are behind the steering wheel of a car.

Motors have no sex. Lady drivers must learn to expect no more consideration when travelling than is given to men—for one is rarely able to distinguish the driver until level with the car—and they must also learn, and learn quickly, that they must give the same consideration and courtesy on the road as is given by men to men.
Ilkley. A WORM TURNED OVER.

A NON-MOTORIST'S WANTS.

Sir,—As a non-motorist through choice, I was much interested by "Ixion's" remarks on "More Sales." I think, however, that I and a large number of my friends fall into yet another group.

What we want is a medium-weight machine, price about £60, which, with the exception of tyres and sparking plugs, *will not go wrong.* It must also afford protection from the weather and be reasonably silent. G. S. P.
London, S.W.

THE TRUTH ABOUT TUNING.

Sir,—"Bemsist's" letter, whereby with two apparently simple alterations to a standard Rudge-Multi, he claims additional 13 or 14 m.p.h. to the maximum speed, is most difficult to digest with belief.

The maximum speed of a Rudge-Multi in good standard tune, fitted with a 17½in. belt rim, lies between 55 and 58 m.p.h. "60," that elusive figure, can sometimes be attained, with a following wind, or in calm conditions on a good road.

Taking 58 m.p.h., plus "Bemsist's" extra 14 m.p.h., gives 72 m.p.h., a road speed many big twins would find hard to equal, and this with a single-cylinder engine and a frame and fitments heavy for the size of the power unit.

Admittedly, for sheer pleasurable touring, the Rudge is hard to beat; it will maintain 30 m.p.h. indefinitely, and it also possesses admirable qualities in a fine riding position, easy steering, and a delightful gear.

"Rumgo's" letter is also of interest, as I, too, owned a 1911 Triumph, and was very proud of it, but whilst in agreement with him, that engine cleanliness does not play an important part in increasing "revs.," I would gladly take an omnibus to Canons Park to see a 1911 Triumph climbing Brockley Hill at 48 m.p.h., and naturally would be interested to see this same machine travelling at 63 m.p.h. for a half-mile on the level. My old Triumph in the days gone by, although tuned in every way according to theory and practice, with many tips by the exponents of the game thrown in, would never exceed 57 m.p.h. except downhill.

The "Truth about Tuning," in my opinion, mainly lies in:

1. Design.
2. Perfect alignment of flywheels and shafts.
3. Elimination of friction.
4. Lightness of reciprocating parts, with the relative importance of good balance.
5. Quick ingress and egress of gases.
6. Cam design and valve timing.
7. Compression.
8. Carburation.
9. Magneto timing and strength of spark.
10. Valve springs.
11. Intelligence and a natural aptitude for mechanics.

Last, but decidedly not least, weight of machine, gear ratios, tyre size, wind resistance of various fittings, quality of petrol and oil, atmospheric conditions affecting carburation—all these points merge into the words tuning and speed.

It is a long, long trail of hard, thorough, persistent work, with attention to detail the main factor, carrying disappointments often disheartening. The one great asset is money, and plenty of it. R. LANDON.

ACCORDING TO EXPECTATION!

Sir,—Should I ever chance to meet "Zenooth" (who averaged nearly 50 m.p.h from Barnet to Cambridge) on a blind corner when he is riding a really *fast* machine, I hope to be driving something on four wheels—a road-roller for preference. "BUNSEAM."
Staffs.

Sir,—Since his sports Zenith received scarcely any tuning *up*, may I ask "Zenooth" if his watch received any de-tuning so as to give such results? SQUIRREL.
Manchester. N.Y. 1722.

Sir,—I agree with "Zenooth" when he states that Mr. William's Scott, upon which he can only *average* a mere 35 m.p.h., requires tuning. Certainly I don't know much about Scotts (although I have frequently taken their Emulsion), but I can picture the utter disgust of hundreds of people—prospective motor cyclists possibly—who would shudder to see such a machine "pottering" along the High Street or "loitering" about dangerous cross-roads at an average of *only* 35 m.p.h. SEAPLANE.
Wembley.

Sir,—We have shown "Zenooth's" statements to several of our customers, who expressed surprise that he has been unable to exceed 50 m.p.h. over such a good road as the Barnet-Cambridge.

One of them rides a super-sports Triumph Junior, and on a recent occasion he completely wiped up another gentleman on a Wall Auto-wheel. This exciting event was over a course from Chatham to Maidstone, and the average speed of the winner was just over 60 m.p.h., time taken by alarm clock strapped to the handle-bars, and distance by standard tape measure. ANANIAS BROS.
Rainham.

Sir,—Were it not the constant reiteration of the phrase "I consider these by no means extraordinary speeds," one might have been led to suppose "Zenooth" a mere stripling of such limited experiences to consider any average above 40 or so m.p.h. in some way wonderful. But the roads on which he made these little jaunts are nearly all perfect speedways, with suitably disposed villages and cross roads to lend interest and excitement. In fact, I and my friends have often advocated in the local courts (having been summoned thither for loitering on the highways) that the roads between Cambridge and Barnet be closed to such slow traffic as "Zenooth." How often have I found my way blocked by some be-helmeted, green-goggled apparition plodding nervously along the middle of the road at a bare eighty-five!
Cambridge. MUNCHAUSEN JUNIOR.

Sir,—Your correspondent "Zenooth" has surprised me greatly by his letter. I can only assume that it refers to a criticism I made some weeks ago of a rider who claimed to *average* 35 m.p.h. with a 350 c.c. sidecar outfit. This speedy scribe had the good grace to modify his statements, and I thought the whole incident was closed.

It is only fair to myself to mention that I am quite a peaceable individual, with no desire to quarrel with anyone, but statements of the kind now made by "Zenooth" cannot be allowed to pass. It is with genuine regret that I feel forced to say quite frankly that I do not believe him, and that no experienced motor cyclist will accept his claims.

It should be distinctly understood that in my original letter I did not single out the Scott-Squirrel for special praise. I mentioned it merely incidentally, feeling strongly that if an average of 35 m.p.h. was difficult even on such an exceptionally fast solo machine as the Squirrel, it was totally impossible on a standard 350 c.c. sidecar outfit. What I said of the Squirrel applies, of course, to any fast machine, and I maintain most emphatically that a 35 m.p.h. average, riding solo, is excellent even for a Brough-Superior or Henderson. As a matter of fact, I do consider the Squirrel to be capable of a higher *average road* speed than any other mount, irrespective of horse power. Mine, like any other Squirrel, will attain speeds of from 63 to 67 m.p.h. where road conditions permit, and that is seldom. It will hum round corners where "Zenooth" would be climbing the hedge. So that his advice that it needs tuning is hardly required. But all this is beside the point.

"Zenooth" has the audacity to claim averages of from 40 to 50 m.p.h. on quite lengthy journeys (including the little village of London), and this on a machine which I have never heard spoken of as particularly fast. Next to his audacity I am charmed most by his modesty, for he does not consider his speed as at all abnormally good. I hesitate to think what will happen when he really does open out a bit. For the speeds he could attain if he would only take the trouble may I suggest that a watch in his overcoat-pocket is hardly good enough? What about a grandfather's clock on the handle-bars? N. WILLIAMS.

Sir,—If "Zenooth" can only average 50 m.p.h. on his Zenith I should advise him to tune it up, because I am as certain as he is that he is next year's T.T. winner.

I myself ride a 999 c.c. Halt-Dropdedd, which is an excellent 'bus where many stops are required, and the only thing that has been done in the way of tuning is that the cylinders and pistons have been drilled. I do not consider my averages excessive or abnormally good, but any motor cycle which is meant for speed ought to do likewise if it has got a rider like me or "Zenooth." I am, like "Zenooth," very modest, and so I must tell you that the best of these in my opinion is from Barnet to Mudspot-in-Pottole (including London, of course), where I put up at "Zenooth's" favourite inn, "The High Flyer." The distance, which is 80 miles, I covered in 79 minutes, a trifle over 60 m.p.h. The time was taken by a grandfather clock strapped on to the carrier, and the mileage reckoned by counting the telegraph posts.

I may mention that, as a short cut to speed, I used the new hot-air fuel "Bemsist Gas," discovered by *The Motor Cycle* last week, and was disappointed with it. It takes up valuable space, and is of no practical use.
Green Field. IMA NUTHER.

TAPPET CLEARANCES AND NOISE.

Sir,—The insertion of a 15-1,000 in. feeler between tappet and valve stem would not have a decompressor effect unless the clearance was less than 15-1,000 in.

Suppose that the clearance was 16-1,000 in.—the insertion of a 15-1,000 in. feeler would alter the valve timing very considerably.

The amount would depend on the cam contour.

In the case of a more or less "constant acceleration" cam, (*i.e.*, a standard cam), the insertion of a 15-1,000 in. feeler would alter the valve timing approx. as follows:—In case of exhaust valve, the valve would open 15 or 20° before it would do if there was 15-1,000 in. clearance.

The exhaust valve would close about 20° *after* it would do if clearance of 15-1,000 in. existed. So that even with a standard cam you would get at least 35° difference in the length of time for which the exhaust valve remained open.

In the case of a quick lift high efficiency cam the difference would, of course, be very much greater. And, therefore, be much more noticeable.

Supposing practically no clearance was given on the exhaust valve tappet.

This would have the effect (as stated previously) of causing the exhaust valve to close about 20° later than it should do. (I believe 12-1,000 to 15-1,000 in. is standard clearance on a 500 c.c., or thereabouts, single.)—[6-1,000 to 12-1,000 in. is probably nearer.—ED.]

This would allow a proportion—a large proportion—of the incoming gas to be swept out of the cylinder *via* the exhaust port, causing loss of power at slow speeds and poor petrol consumption. ALBERT W. BRITTAIN, Capt.

ENTHUSIASTIC CLUBMEN.

Sir,—"One swallow does not make a summer," I know, but if the West Kent M.C.'s experience this season is any criterion, there is far less apathy towards competitions among Kentish riders than in the club of which "Fed-up" is a member. Our last fixture, a reliability trial, on October 15th, brought an entry of more than double that for similar competitions earlier in the year, and the course was, perhaps, the severest yet used by the club. Our membership is less than seventy, yet the entry list numbered forty-seven. Most of the remainder were out on various "jobs" connected with the competition. A. E. JESSOP.
Hon. Competitions Secretary.

THE ETHICS OF "HANGING ON."

Sir,—While out for training spins on the Coventry road I often "hang on," and have never yet found anyone objecting; in one case, in fact, a couple in a sidecar outfit seemed highly amused to watch me furiously pedalling and perspiring profusely, and paced me from about one mile out of Coventry to Dunchurch, where I turned off.

A thing I should like to point out to "Benedict" is that, when furiously pedalling, one does not usually listen carefully to the conversation of the couple in the sidecar. And again, a racing machine used for training on the road is usually in perfect condition, and therefore capable of being pulled up, in the case of the pacing outfit stopping, without any risk of a collision. D. BOROVIKOVSKY.

TOO EXPENSIVE SIDECAR OUTFITS.

Sir,—I should like, if I may, to draw the attention of your readers to the high prices at present being asked for high-powered sidecar outfits. On glancing through the advertisements in a recent issue of *The Motor Cycle*, I noticed that the average price, new, of a big twin sidecar outfit was somewhere in the region of £147, and I must admit that this seems to me to be somewhat excessive, having regard to the fact that a well-known three-wheeler of the runabout type may now be bought for £135.

To the majority of would-be motorists this must seem particularly strange, as the latter type of vehicle possesses several undeniable advantages over the sidecar outfit, namely :—

1. The driver, in addition to his passenger, is provided with adequate protection against the weather.
2. Much greater comfort to its occupants
3. Better facilities for conversation.
4. Less physical effort to drive; and
5. A more uniform and compact appearance.

These features, with the possible exception of the last, all add to the pleasures of motoring, and if the runabout is as efficient, mechanically, as the sidecar outfit of equal power as regards ordinary, everyday uses, why cannot the latter be bought for something like £110 or £115?

Having in view the big reductions in prices of many light and medium powered cars, I see no reason why this should not be possible. £ s. d

Birmingham.

RACE TRACKS OF LIMITED USE.

Sir,—It is splendid news to hear that attention is being turned to the building of tracks in various parts of the country. I fail to see, however, what use the Derby one is going to be.

We are told that speeds up to 80 m.p.h. can be attained with reasonable safety. Now there are few racing machines these days in the 500 c.c. classes and above that cannot lap Brooklands at a minimum of 74 m.p.h., which means a maximum speed of over 80 m.p.h. Result—exit 500-1,000 c.c. racing machines. This leaves the 250 and 350 c.c. classes, whose speeds, however, are rapidly approaching the danger mark, and in some cases far exceed it already.

In other words, the only likely users will be private owners' "sports" models, and badly tuned or broken-winded big twins.

It is stated that if these tracks are well run and good viewing accommodation is provided, "football gates" might be expected as at American tracks. But will the crowds be attracted by a third-rate show, which it surely will be since the cracks will be absent for the reasons stated above?

When building a track, why on earth not produce something consistent with modern speed progress. Not to do so literally hinders efforts in the latter direction. Although it is not intended to compete with Brooklands, it certainly seems unwise to start behind the times. A similar track would have been the very thing ten years ago.

Perhaps there is a reason, but it appears to me to be like mounting a large gun in a flimsy ship, with a risk of it jumping overboard when fired. In ship construction you build the ship to take the gun. Therefore, where is the flaw in my statement when I say build the track to take the bike? There probably is a flaw. I'm only asking.

NORTICAL.

FOUR-CYLINDER AS SPORTING MOUNT.

Sir,—It would appear from your road test report of the 748 c.c. F.N. sidecar that you do not consider it fast enough to be classed as a sporting machine; perhaps my experience of this model, used with a *light* sidecar, may be of interest.

The following speeds were obtained on the level :—Over 30 m.p.h. on first, 44 m.p.h. on second, and 53 m.p.h. on top gear. W. F.

Leytonstone.

ORGANISATION OF AN A.C.U. OPEN TRIAL.

Sir,—Since the A.C.U. grant a limited number only of permits for open events, surely it is up to that body to see that these events are properly organised, and do not develop into such a fiasco as was the Cheshire Centre Open Trial on October 21st.

The trial should originally have been held on the 22nd July, but was postponed until the 2nd September, and again postponed until the 21st October, by which time forty competitors had entered.

The idea of a petrol consumption test on A.C.U. formula was abandoned at the last minute, and competitors were instructed to have their watches sealed.

The first sixteen miles of the route consisted entirely of good main road, which was profusely decorated with gallons of blue dye. However, on leaving the main road, and making our way towards Mow Cop, not the slightest trace of dye, or marking of any description, was encountered until we arrived at Leek, the lunch stop.

On arriving at the official garage, we were surprised to find that the checker had not arrived, so no one checked us in. Eventually the checker arrived in time to take the times of the last twenty competitors, but it was afterwards decided to wash the check out altogether.

After lunch the majority of the competitors decided to retire as a protest against the way in which the trial was carried out, but on being assured by one of the marshals that the remainder of the course would be well marked, agreed to carry on.

At first the marking was good, but gave out again near Ford. We carried on like this for about twenty miles, when red dye was encountered near Litton Slack.

On making enquiries from the marshal there, we were told that the course would be marked with red dye, and to follow that. This we did, with the result that when we should have been in Macclesfield, about twenty of us found ourselves within a mile of Leek, and discovered that the trail which we were following was being laid for a trial the next day! Of course, we checked in at Knutsford about thirty minutes late, thus losing any chance of an award.

H. A. LEACH.

[We understand that the Auto Cycle Union is investigating this matter.—ED.]

"THE MOTOR CYCLE" ROUTE BOOK.
With 32 pages of Road Maps. Price net, 2/6. By post, 2/10.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., Dorset House, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

CLUB NEWS

Lee, Lewisham and District M.C. and L.C.C.

Solo machines, sidecars and light cars will compete for the Phillip's Challenge Cup over a sporting non-stop course on the 12th inst.

Middlesbrough and District M.C.C.

Remarkable results were recorded in a fuel consumption trial held on the 14th ult., as shown by the 201.9 m.p.g. achieved by the winner of the premier award. Results, which show ton-miles per gallon in addition to miles per gallon, are as follows:—

1, G. W. Dawson (492 Sunbeam), 39.12 t.m.g. and 201.9 m.p.g., winner of Sadler Bowl; 2, A. Young (976 Morgan), 34.79 t.m.g. and 72.3 m.p.g.; 3 G. Gilchrist (799 A.J.S.), 33.32 t.m.g. and 75.1 m.p.g.; 4, A. Buttress (595 Douglas), 32.13 t.m.g. and 163.2 m.p.g.; 5, E. Price (A.B.C. car), 31.8 t.m.g. and 40.5 m.p.g.; 6, L. B. Dickenson (350 Diamond), 22.91 t.m.g. and 159.4 m.p.g.; 7, J. Withington (481 Scott), 21.35 t.m.g. and 72.7 m.p.g.

Stalybridge and District M.C.

Under almost ideal conditions the club recently held its last speed trials for this year. Owing to defective working of the electrical timing apparatus, the telephone was resorted to, but, in spite of this fact, the event was run off to a satisfactory conclusion within three and a half hours. Times and results over the course of one third mile are as follows:—

350 c.c. (STANDING START).—1, B. Watts (342 D.O.T.), 25⅘s.; 2, Dean (349 o.h.v. New Scale), 35s.; 3, S. Dawson (348 Metro-Jap), 39s.

550 c.c. (STANDING START).—1, T. Simister (490 o.h.v. Norton), 22⅖s.; 2, C. Dodson (492 Sunbeam), 22⅘s.; 3, E. W. Wilkinson (492 Sunbeam), 24s.

750 c.c. (STANDING START).—1, T. Simister (490 o.h.v. Norton), 22⅖s.; 2, C. Dodson (492 Sunbeam), 23s.; 3, E. W. Wilkinson (492 Sunbeam), 24s.

1,000 c.c. (STANDING START).—1, T. Simister (490 o.h.v. Norton), 22⅕s.; 2, C. Dodson (492 Sunbeam), 22⅘s.; 3, T. Spann (492 Sunbeam), 22⅗s.

UNLIMITED C.C. (STANDING START).—1, C. Dodson (492 Sunbeam), 22⅘s.; 2, T. Simister (490 o.h.v. Norton), 22⅕s.; 3, T. Spann (492 Sunbeam), 23⅛s.

350 C.C. (FLYING START).—1, B. Watts (342 D.O.T.), 19⅖s.; 2, A. Margrave (349 Dean), 25s.

550 C.C. (FLYING START).—1, T. Simister (490 o.h.v. Norton), 18⅖s.; 2, G. E. Cowley (490 Norton), 19s.; 3, B. Watts (342 D.O.T.), and T. Spann (492 Sunbeam), 19⅗s. (tie).

750 C.C. (FLYING START).—1, T. Simister (490 o.h.v. Norton), 18s.; 2, T. Spann (492 Sunbeam), 19s.; 3, C. Dodson (492 Sunbeam), 19⅗s.

1,000 C.C. (FLYING START).—1, T. Simister (490 o.h.v. Norton), 19s.; 2, C. Dodson (492 Sunbeam), 19⅗s.; 3, G. E. Cowley (490 Norton), 19⅘s.

UNLIMITED (FLYING START).—1, C. Dodson (492 Sunbeam), 18s.; 2, T. Simister (490 o.h.v. Norton), 19s.; 3, T. Spann (492 Sunbeam), 19⅛s.

550 C.C. SIDECARS, STANDING START.—1, C. G. Bullough (490 Norton sc.), 27⅛s.; 2, T. Simister (490 o.h.v. Norton sc.), 28s.

750 C.C. SIDECARS, STANDING START.—1, T. Simister (490 o.h.v. Norton sc.), 27⅗s.; 2, C. G. Bullough (490 Norton sc.), 28⅗s.

1,000 C.C. SIDECARS, STANDING START.—1, T. Simister (490 Norton sc.), 28⅛s.; 2, C. C. Bullough (490 Norton sc.), 31⅖s.

UNLIMITED C.C. SIDECARS, STANDING START.—1, T. Simister (490 o.h.v. Norton sc.), 28⅖s.; 2, C. G. Bullough (490 Norton sc.), 28⅘s.

550 C.C., FLYING START.—1, T. Simister (490 o.h.v. Norton), 23⅘s.; 2, P. Platt (490 Norton), 35s.

750 C.C. SIDECARS, FLYING START.—1, T. Simister (490 o.h.v. Norton), 23s.; 2, P. Platt (750 Bradbury), 25⅛s.

1,000 C.C. SIDECARS, FLYING START.—1, T. Simister (490 o.h.v. Norton), 23⅛s.; 2, C. G. Bullough (490 Norton), 25⅛s.

UNLIMITED SIDECARS, FLYING START.—1, T. Simister (490 o.h.v. Norton), 28⅖s.; 2, C. G. Bullough (490 Norton), 28⅗s.

SPECIAL AWARDS FOR FASTEST AMATEUR TIME OF THE DAY.—1, T. Spann (492 Sunbeam), 18⅘s.; 2, E. Barnes (492 Sunbeam), 20⅖s.; 3, F. Cheetham (490 Norton), 21s.; 3, S. Buckley (490 Norton), 21s.; 3, E. W. Wilkinson (492 Sunbeam), 21s.

GOLD MEDAL FOR FASTEST TIME OF DAY.—T. Simister, 18s., after re-run for tie with C. Dodson.

Woolwich M.C.

A novel after-dark trial has been suggested, and it is honed to arrange final details at the next committee meeting.

South Midland Centre A.C.U.

The North London M.C.C. won by one point the inter-club contest at the Kop Hill-climb, not the North-West London M.C.C. as previously stated.

Wallington M.C.

A Cinderella Dance will be held at the Public Hall, Carshalton, on the 17th inst., at 7.30 p.m. Tickets are obtainable from the hon. secretary, Mr. Clifford Bowen, The Chalet, Woodcote Avenue, Wallington.

West Kent M.C.

Forty-seven competitors engaged in keen rivalry for the Prof. Wilson Silver Challenge Cup on the 15th ult. The course consisted of two circuits of 26 miles each, and embraced a newly-discovered freak hill, "christened" Beacny Head, which proved to be a narrow and steep bridle path, succeeded by three fields and two gates. Awards were made as follows:—

PROF. WILSON SILVER CHALLENGE CUP.—A. C. Ward (550 Triumph sc.).

SILVER AWARDS.—A. E. Jessop (348 Francis-Barnett), F. Logan (348 Francis-Barnett), E. C. Gordon (499 Triumph), D. F. C. Fitzgerald (490 Norton), V. F. Long (976 Excelsior sc.), T. Haynes (796 Ariel sc.), P. Polhill (976 Zenith sc.), J. L. Boxhall (678 N.U.T. sc.), R. V. Crawford (1,301 Henderson sc.).

BRONZE AWARDS.—L. Williams (348 Massey-Arran), A. Chinnery (292 Allon), C. R. Peerless (550 Triumph), P. G. Peerless (550 Triumph), E. W. Tyler (499 Sunbeam), W. H. D. Steer (499 Sunbeam), C. S. Pearce (348 Coventry-Eagle), F. J. Griffen (348 Coventry-Eagle), W. G. Pierce (998 Harley-Davidson), B. F. G. Fowke (Beardmore-B. and S.).

The next and last fixture for the present season is a hill-climb, to be held at Vigo Hill, near Wrotham, on the 29th inst.

Stourbridge and District M.C.C.

Provisional results of the club's annual sporting trial for the Wallace Cup and other awards, held recently, are as follows:

WALLACE CUP.—W. Worral (492 Sunbeam).

STOUR VALLEY CUP, for best performance by machine under 275 c.c.—Mrs. H. Gale (249 Velocette).

TEAM PRIZE.—Worcester and District M.C.C. team, consisting of: A. W. Carr (976 Morgan), H. F. S. Morgan (976 Morgan), J. A. Chadwick (249 Velocette).

CLUB SILVER MEDALS.—W. Worral (492 Sunbeam); E. Hipkins (349 A.J.S.); A. W. Carr (976 Morgan); H. F. S. Morgan (976 Morgan).

CLUB BRONZE MEDALS.—F. S. Barnes (492 Sunbeam); E. Elt (349 A.J.S.); J. Dosher (225 Royal Enfield); E. Donnisthorpe (348 New Imperial); J. Gething (633 Norton sc.); H. Graves (976 Enfield sc.); F. Ferriday (348 Omega); E. Griffiths (490 Norton); J. Chadwick (249 Velocette); W. E. Smith (490 Norton); P. H. Cranmore (481 Scott); W. L. Mattey (557-B.S.A.); E. Dumbleton (348 Rex-Acme).

The next outdoor fixture is the annual "Heroes' Cup" one-day trial on Boxing Day, December 26th, when it is hoped that the usual muster of sportsmen will be present.

Croydon and District M.C.C.

A one-day reliability trial has been organised by the above club, and will take place on the 5th inst. The premier award is a silver trophy—the president's cup, while there will be a team prize and the usual medal awards. Entries close last post Saturday, the 28th inst.

North London M.C.C.

Thanks to the St. Albans and District M.C.C., the club was enabled to hold its annual speed trials on the 14th ult. at Bedwell Park, near Essenden. An excellent half-mile course was provided, and the event was run off without a hitch. Awards were made in the motor cycle classes as follows:—

350 c.c.—F. J. Youngs (348 O.K.-Blackburne), 26⅕s., silver medal.

500 c.c.—E. Richardson (490 Norton), 25s., silver medal.

600 c.c.—R. R. T. Bowen (550 Coventry-Eagle), 30⅖s., silver medal.

750 c.c.—C. C. Labin (678 Martinsyde), 29⅗s., bronze medal.

1,000 c.c.—C. C. Labin (678 Martinsyde), 27⅖s., bronze medal.

600 c.c. SIDECARS.—E. C. Gordon (499 Triumph sc.), 37⅕s., bronze medal.

1,000 c.c. SIDECARS.—R. W. Greaves (976 Brough Superior sc.), 31⅘s., bronze medal.

500 c.c., ANY MACHINE.—E. Richardson (490 Norton), 25⅘s., silver medal.

1,000 c.c., ANY MACHINE.—E. C. Gordon (499 Triumph), 27⅕s., tied with C. C. Labin (678 Martinsyde), 27⅘s. Re-run: 1, C. C. Labin, 27⅖s., silver medal; 2, E. C. Gordon, 27⅘s., bronze medal.

GOLD MEDAL FOR FASTEST TIME OF DAY.—E. Richardson (490 Norton), 25s.

Worthing M.C.C.

Results of successful speed trials held at Amberley on the 15th ult. are as follows:—

MR. CECIL VOLK'S PRIZE for fastest time made by a competitor who has not won an award in a speed trial or hill-climb. 350 c.c.—1, W. H. Sheraton (349 Sheffield Henderson), 12⅗s.; 2, B. Packham (348 Douglas), 15⅗s.; 3, E. Brookman (348 Raleigh), 16⅛s. The first competitor having won a prize before, the award was given to B. Packham (348 Douglas).

MR. ALEC FRASER'S PRIZE for fastest time made by a competitor who has not won an award in a speed trial or hill-climb. 600 c.c.—1, A. Fraser (499 Sheffield Henderson), 10⅛s.; 2, C. Volk (494 Douglas), 11⅜s.; 3, E. A. L. Parker (494 Douglas), 12⅝s. The first and second competitors having won prizes before, the award was given to E. A. L. Parker (494 Douglas).

MR. W. H SHERATON'S PRIZE for fastest time made by a competitor who has not won an award at a speed trial or hill-climb. 600 c.c.—1, B. S. Allen (976 Brough Superior), 10⅝s.; 2, J. A. Bowles (976 Zenith), 12⅛s.; 3, C. V. Rice (650 Zenith), 13⅗s., or 66.176 m.p.h. average. The first competitor having won a prize before, the award was given to J. A. Bowles (976 Zenith).

SIDECARS.—1, A. Fraser (499 Sheffield Henderson sc.), 13s.; 2, F. D. Winslow (550 XL sc.), 17½s.; 3, J. W. Coombes (770 Hawk sc.), 22⅝s.

FASTEST TIME OF THE DAY was made by B. S. Allen (976 Brough Superior), who covered the course in 10⅝s.

ADVANCE DETAILS OF 1923 MODELS.

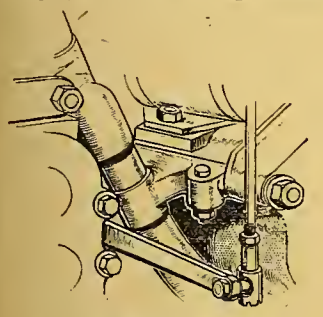
VELOCETTE IMPROVED BY RACING PRACTICE.

Modifications Giving Increased Efficiency and Greater Silencer.

FEW small two-strokes have so good a reputation in the minds of the public as the Velocette.

It is not surprising, therefore, to find that the general lines of the machine remain very much as before; nevertheless quite considerable changes have been made in the engine design.

The latest engine has a bore and stroke of 63×80 mm. (249 c.c.) and is a development of the racing Velocette engine which has broken many records on Brooklands. Instead of the loose aluminium head employed on the racing machine, a



Cotters are used to fix the rear engine bolt on the latest Velocette.

combined casting in iron is now employed and the ports are most interesting in shape.

Following the lines of the racing engine, two separate exhaust ports, spaced widely apart, protrude from the main cylinder casting, thus allowing a draught of air to impinge on a considerable area of cylinder wall between the ports to cool what is normally the hottest point of a two-stroke engine.

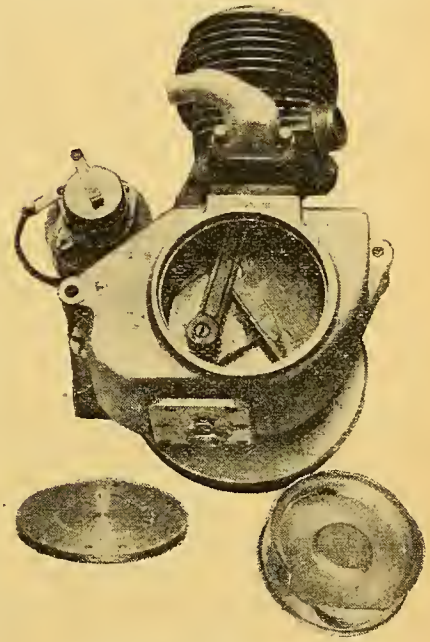
In shape the actual ports in the cylinder wall are unusual, for instead of being rectangular slots, they are curved upwards at the outer edge, thus allowing a small percentage of gas to escape early, which has been found to produce a quieter exhaust without detracting from power or petrol consumption.

Careful Exhaust Box Construction.

Considerable attention has been paid to the silencing question, and the pipes which lead to the silencer are flattened out as they reach the main expansion box, which they join tangentially. Actually this large expansion box is divided in the middle, forming two separate compartments, a tail pipe, of course, extending from each side. In addition, the joints between the pipe and cylinder and expansion box are very carefully made so as to avoid leakage.

A B. and B. carburetter supplies the gas, through a triangular shaped inlet port. The cast-iron piston carries two narrow rings at the top. Modifications to the baffle plate on the piston head have considerably reduced any tendency to knock. Slight modifications have been made to the crank case and a larger balance weight is now fitted.

In attaching the unit to the frame it has been found that the rear engine bolt is apt to work loose in its housing, and this trouble has been got over by cottering the bolt to its lug on each side of the main frame. Apart from this point and the fact that the top tube is now curved downwards towards the rear in addition to its initial slope, there is little change in the frame. It has, however,

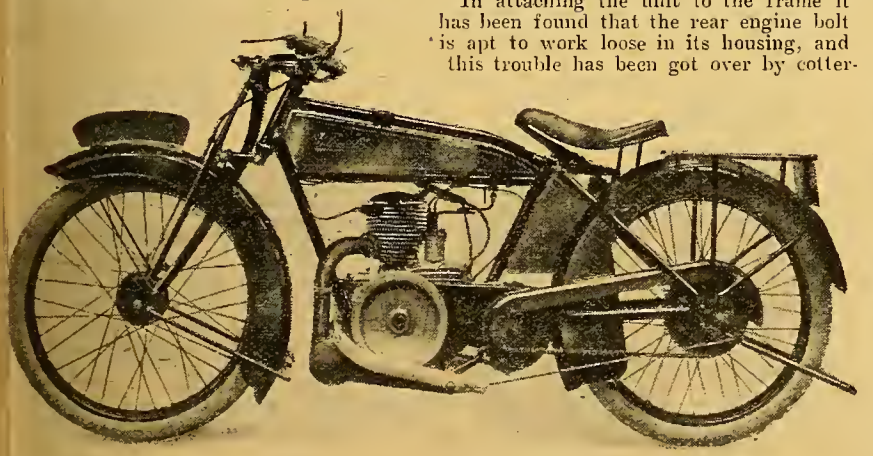


Coverplate to crank case removed to show overhung crank.

been found desirable to employ a lower tank rail, to which the gear lever is attached.

Aluminium footboards are supplied on the standard machines, and these are constructed specially to enable leg shields to be neatly fitted if required. It will be remembered that internal expanding brakes are fitted to both front and rear wheels, while all-chain drive is employed on each model. Provision is made for lubricating the front chain by means of three holes drilled through the flywheel boss to the sides of the engine sprocket, so that any overflow of oil from the single main bearing is led direct to the chain. The Velocette system of mechanical pump lubrication is, of course, retained.

Mudguarding has been somewhat improved, and on the three-speed models 24in. × 2½in. tyres are fitted.



In addition to a new engine and a curved top frame tube, the 1923 Velocette is remarkable for its extensive mudguarding, particularly of the rear wheel.

Advance Details of 1923 Models.—
The following machines will be listed for the forthcoming year: standard or sports model, with two-speed gear, £62; standard or sports model, with three-speed gear, £65, or with sidecar, £85. A lady's model to which the existing 220 c.c. engine will be fitted in conjunction with a two-speed gear and leg shields, is listed at £63.

An important point is that the manufacturers are prepared to guarantee a mileage of 120 to 130 to the gallon, and with a machine in good condition this figure can be comfortably exceeded.

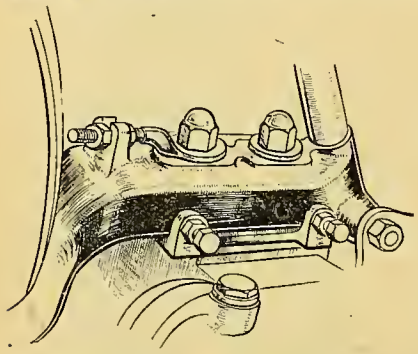
VARIED RANGE OF O.K. LIGHTWEIGHTS.

250 c.c. and 350 c.c. Four-stroke and 292 c.c. Two-stroke Models.

ONE of the first firms to realise the importance of moderate selling prices in post-war days was Humphries and Dawes, Ltd., the manufacturers of the well-known O.K.-Junior motor cycles.

In spite of the fact that this firm has always made a strenuous effort to keep its prices as low as circumstances permitted, the quality of the productions has not suffered.

For 1923 the most obvious change in design is the modification of the frame top tube, which is now curved backwards from the head, giving a very racy and pleasing outline. This, however, is by



Positive chain adjustment and bracket for lining up gear box on O.K. Junior.

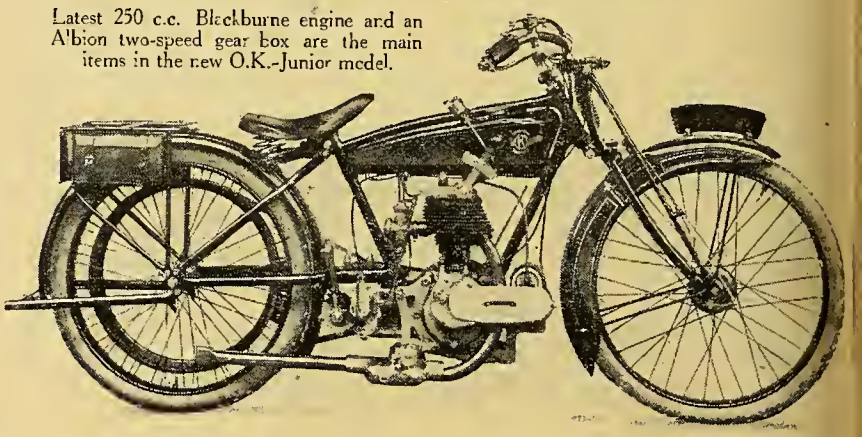
no means the most important of the detail alterations. Larger steering head races are fitted, ¼in. balls being employed; the saddle pillar lug is made in one piece, to which are brazed the saddle tube and two tank tubes; solid eyes are brazed into the back stays in place of flattened ends.

Chain Adjustment Facilitated.

A new bottom bracket lug has been designed, and the gear box is mounted on a special cradle, by means of which the chain line can be adjusted by set screws, and once adjusted it is impossible to upset the setting when tightening the front chain.

The gear box is moved longitudinally by means of a draw bolt, so that the chain may be tightened to the correct degree without undue trouble.

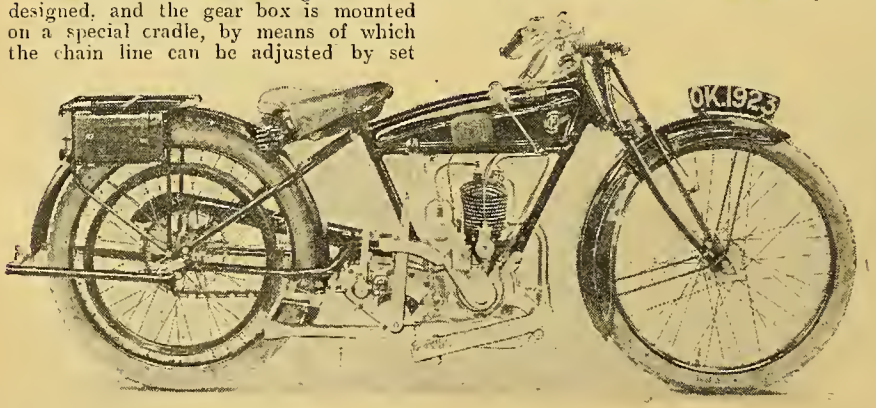
Latest 250 c.c. Blackburne engine and an Albion two-speed gear box are the main items in the new O.K.-Junior model.



Two-stroke Models.

A single-geared machine is listed with the O.K. two-stroke engine (70 × 76 mm. = 292 c.c.), and will be sold at a strictly moderate price. Next comes a two-speed, clutch, and kick-starter model with chain and belt drive. This may be fitted with either the O.K. engine or the new 250 c.c. side-by-side valve Blackburne. In either case, an Albion gear is used, and Brampton forks, specially widened to accommodate flat-sectioned guards with full valances, are employed.

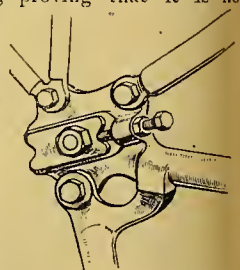
The wheels are shod with 26 × 2¼in. tyres, the O.K. compensated belt rim brake being applied to the rear wheel, while the front wheel is checked by an internal expanding brake, which is particularly easy to dismantle should replacements be necessary. Great care has also been taken in the design of the anchorage, the anchor plate being in direct tension.



O.K.-Junior chain-driven two-stroke model which is now fitted with Brampton forks.

For Light Sidecar Work.

Having a somewhat similar specification, a three-speed machine may be obtained with the O.K. two-stroke or 350 c.c. side-by-side valve Blackburne engine. In this case the Moss gear has been selected, and 26 × 2½in. tyres are fitted, chain drive being employed throughout; brakes are as above, but a Terry spring saddle is fitted. This machine may be obtained with a light sidecar, and, thus equipped, has earned an exceedingly good name in long-distance reliability trials, proving that it is no toy but a thoroughly practical and serviceable article. Rubber knee grips are screwed direct to the tank, thus doing away with unsightly straps, and the rear mudguard is perfectly clean in appearance, since the steel strapping is inside the dome of the guard.



A reversible plate on the rear spindle enables a short adjusting screw to be employed

As may be expected, the 250 c.c. overhead valve Blackburne engine is listed in the sports model. Briefly, the specification is similar to that of the touring models except that a racing Brampton fork is used and the machine is minus such accessories as aluminium footboards, while lighter guards both to the wheels and chains are employed.

DUPLEX FRAME LIGHTWEIGHTS.

Three Grigg Solo Models and a Light Sidecar for 1923.

FOR next season there will be three models of the Grigg motor cycle, together with a sidecar suitable for attachment to the largest. These models range from a miniature to a 350 c.c. two-stroke capable of taking a sidecar.

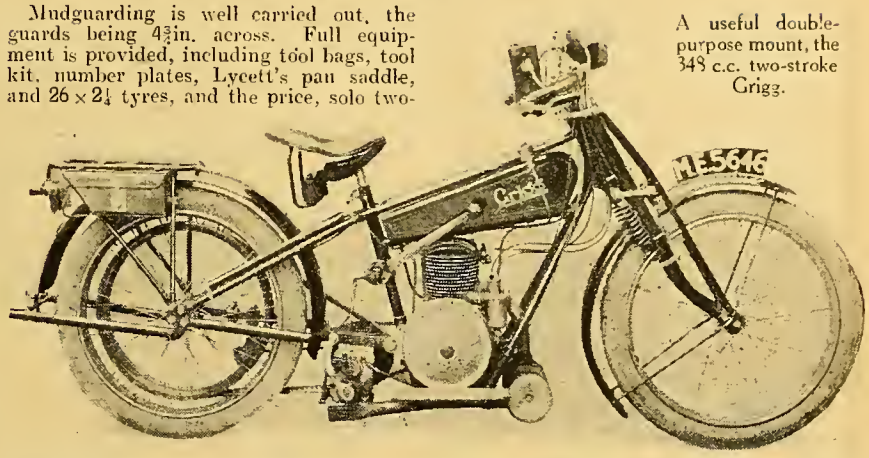
One of the most attractive features of the Grigg is its duplex frame design, to which favourable reference was made in our pages at the time of last show. This frame is utilised for the two larger models, of which the most powerful is fitted with a 348 c.c. Villiers two-stroke engine with flywheel magneto and lighting equipment. It is practically a double-purpose machine, but the solo model has only two speeds—6¼ and 11 to 1, while the sidecar machine has three speeds: a Sturmey-Archer box is used in both cases, drive being by chain and belt.

A noteworthy feature of the machine is its exceptionally large expansion chamber, which, with an extension pipe with drilled and flattened end, should render the engine quiet, yet free from back pressure.

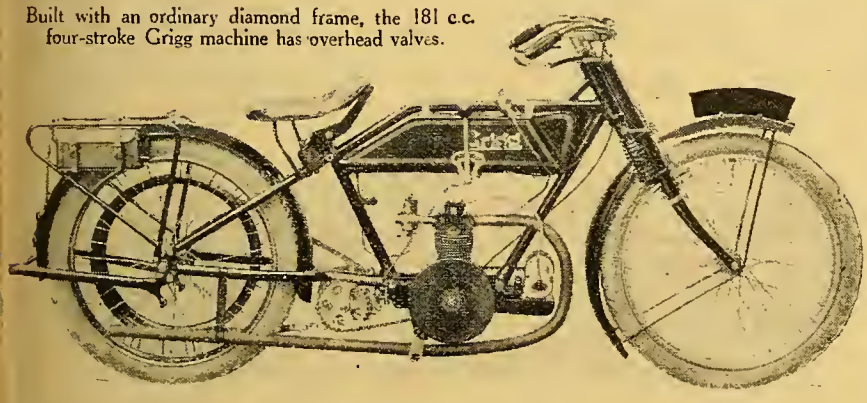
Mudguarding is well carried out, the guards being 4¾in. across. Full equipment is provided, including tool bags, tool kit, number plates, Lycett's pan saddle, and 26 × 2¼ tyres, and the price, solo two-speed, is £60 and the weight 195 lb.; three-speed, £63, and sidecar oufit, £75.

This model may be had with a B. and S. sleeve valve engine for £9 extra.

A useful double-purpose mount, the 348 c.c. two-stroke Grigg.



Built with an ordinary diamond frame, the 181 c.c. four-stroke Grigg machine has overhead valves.



For lighter solo riding the Grigg Engineering Co., Ltd., supplies a 211 c.c. (62 × 64 mm.) two-stroke engine of the three-port type of its own make. Gear box, frame, transmission, Amac carburetter, and Druid spring forks are similar to those of the preceding model. Price £45, weight 168 lb.

Lastly, for novices and elderly riders, a 181 c.c. miniature has been introduced. The engine, which is a four-stroke with overhead valves, has an aluminium cylinder, forming part of the crank case casting, a steel liner is inserted and the head, of cast iron, is detachable.

This little machine is provided with a Chater-Lea two-speed gear box, 24 × 2¼in. Dunlop tyres, and Amac single lever carburetter. The price £37 16s.

It will be thus seen that the Grigg Motor and Engineering Co., Ltd., Winchester Road, Twickenham, provides a full range of models to suit the requirements of various types of riders.

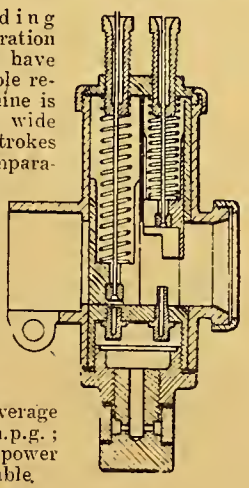
SIMPLIFIED BINKS CARBURETTER.

Moderately Priced Two-Jet Instrument Suitable for Average Machines.

QUITE apart from the range of carburetters which are already marketed by C. Binks (1920), Ltd., is an interesting two-jet model on which experimental work has been proceeding for a very considerable period.

The manufacturers are anxious to point out that this new model does not supersede the Binks three-jet carburetter, but is an instrument designed to be sold at a competitive price and to be suitable for 90 per cent. of the machines which are at present on the market. In this connection we may add that we have had some highly satisfactory experiences with the two-jet Binks in daily use. The manufacturers do not claim any very wonderful results, but have endeavoured to produce a moderately priced article which is as good as anything which can be obtained in the normal way. The latter part of this claim we can bear out, for attached to a Scott-Squirrel (by no means a type of machine lending itself to carburation experiments) we have obtained admirable results. The machine is flexible over a wide range and two-strokes well down to comparatively low speeds. The consumption is good, and it may safely be stated that the machine will average well over 80 m.p.g.; moreover, a full power output is obtainable.

Section of the new Binks 2-jet carburetter.



In construction the carburetter is particularly simple, and it has several practical features, amongst which must be noted the inclusion of a very large diameter fine mesh filter directly below the jets. A pilot jet of extremely small dimensions lies on the engine side of the main body and directly below the D-shaped throttle barrel, the main jet being situated on the intake side and being shrouded by an extension tube of peculiar formation. In action the carburetter is, to all intents and purposes, automatic, for once the engine has been started the air control may be opened almost fully, and the machine driven on the throttle alone. At the same time the air lever is convenient for finding the absolute best mixture when the throttle is wide open, or it may be closed down when very slow running is required so providing an enriched mixture giving good acceleration

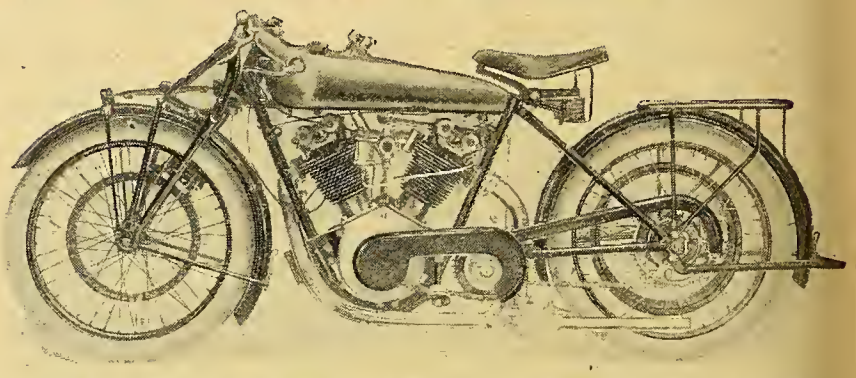
ANOTHER SOLO BIG TWIN.

Anzani-engined Sports Model. Four Overhead Valves per Cylinder.

OF recent times the market for the big twin enthusiast has received more attention from British manufacturers. The latest addition to the steadily growing list of machines in this class is to be known as the Croft-Anzani Super Eight. As may be gathered from the name, the engine fitted is the latest type of Anzani twin with four overhead valves per cylinder.

The engine is housed in a duplex loop frame of sturdy construction, the duplex tubes allowing the exhaust pipes a straight flow between the tubes, the rear pipe passing also through a hole in the bottom bracket casting; the exhaust gases are then led to a large flat cast aluminium silencer, from which the exit is by a tail pipe on either side of the rear wheel.

Transmission is by chain throughout, a close-ratio Sturmey-Archer box being employed, with a shock absorber in the clutch and an Enfield cush hub in the rear wheel. A saddle tank covers the straight top tube, and has a capacity of 3 gallons of fuel and ½ gallon of oil.



One of the few big twins available with four valves per cylinder—the new Croft-Anzani.

Montgomery forks are fitted, and both brakes are of the dummy belt rim type—one on each wheel. Lubrication is by Best mechanical pump.

Since the machine is designed to be of the sporting type the mudguards are somewhat narrow in section, but special wide guards may be fitted to order.

It is expected that the price will be in the neighbourhood of £145, and the makers are the Croft-Anzani Super Eight, St. Michael's Road, Coventry.

SHOCK ABSORBERS FOR SPRING FORKS.

Friction-damping Principle Embodied in B. & D. Stabilizer.

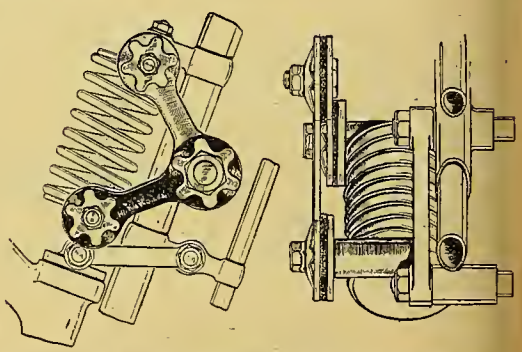
FOR some time now racing cars have invariably included shock absorbers in their equipment; touring cars are rapidly following suit; and the natural sequence would seem to be the application of this device to a motor cycle.

It is not surprising, therefore, to learn that in the B. and D. stabilizer the principle has been applied to the two-wheeler and the sidecar outfit with considerable success. It consists simply of a friction shock absorber, and was evolved on the theory that a spring in itself cannot dissipate or absorb energy; it merely stores it. The reaction or rebound causes a shock just as surely as the initial jar.

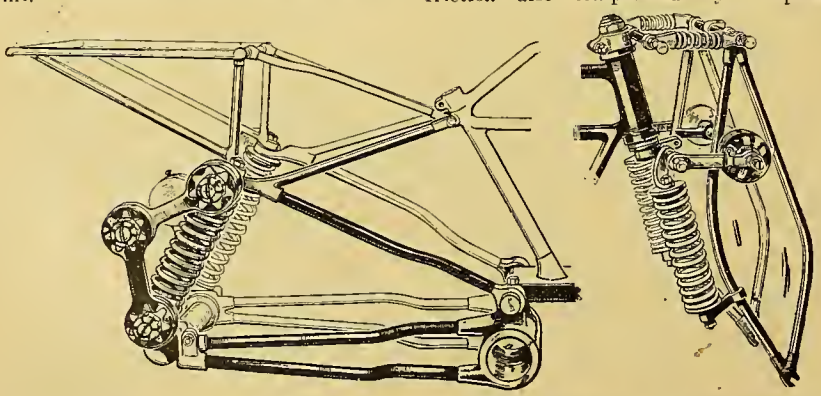
The stabilizer, which is patented, enables very much weaker springs to be used. These naturally give a wider range of action, but since they are damped, there is no possibility of them bottoming or being over-worked to the breaking point.

The system is the result of many years' experiment on Mr. A. D. Draper's (the inventor's) Matchless, which is fitted with his suspension front and rear. A run on this machine convinces us that his claims for greater comfort without any adverse effect on road-holding qualities are not based on theory alone. Even a brick or a three-inch pot-hole may safely be crossed without feeling any real jar, and, what is more important, without setting up a series of oscillations in the unsprung member, perhaps better described as dither.

The damping device is quite simple. It consists of a floating friction disc compressed by a spring washer between any two relatively moving surfaces at a pivoting point in the suspension. Pressure on the spring washer is controlled by a nut, locked by a corrugated washer, which is prevented from rotating by two flats on the main bolt.



B. and D. stabilizer fitted in place of the existing spring on a Druid pattern fork.



Front and rear portions of the Draper spring frame which makes use of frictional dampers on the same principle.

Several forms of the invention have now reached the marketable stage. Perhaps the most interesting is a complete set of springs and dampers, retailing at £2 8s., to replace the existing springs on a Druid type fork. Since weaker, and therefore larger, springs are used, special brackets are supplied to carry them clear of mudguards, etc. The fixtures are thoroughly well made and well finished.

Another set is made for controlling sidecar body suspension. In this case, the existing springs usually have a sufficiently wide and flexible range of action, and only a pair of friction arms is required, for which £1 19s. is charged.

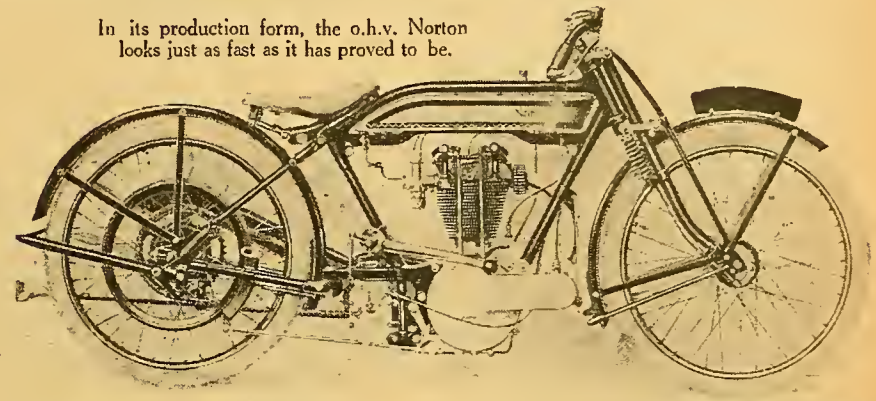
The makers are Bentley and Draper, Ltd., 4, Fenchurch Avenue, London.

OVERHEAD VALVE NORTON MODIFICATIONS.

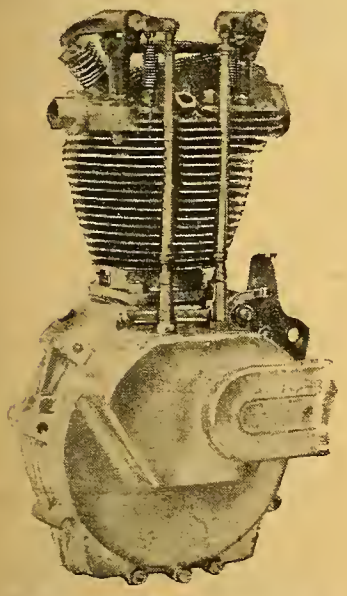
Over-all Height of Engine Reduced. Improved Frame Design.

THOUGH the overhead valve Norton has now been with us for a considerable time it is not generally realised that this type has already been standardised and is obtainable by the buying public.

Since the early machines have proved satisfactory, the modifications which will appear at the forthcoming Olympia Exhibition are comparatively slight, but it has been found to be possible to lower the over-all dimensions of the o.h.v. engine; besides this, the cylinder head ribs have been modified to provide increased cooling area, and several details have undergone minor alterations.



In its production form, the o.h.v. Norton looks just as fast as it has proved to be.



Clean, sturdy design and construction are followed in the o.h.v. engine.

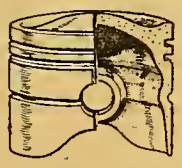
Forged steel rocker standards have now replaced the bronze castings, the rockers themselves being carried on double row roller bearings. The push rods have separate return springs, and the valves are held in their seats by double concentric springs. Special care has been taken to provide cooling for the exhaust valve stem and guide. The upper spring cup is locked by split taper collars, the cup being drilled so as to permit a passage of air which flows owing to the pumping action of the valve. At the base these springs rest on a cleverly-designed washer which is corrugated in such a manner as to allow of a direct draught of air to the valve guide.

Internally the engine has undergone but little change, but a new piston of the semi-slipper variety has been designed. The head of this piston is of a somewhat peculiar shape, in order to allow the use of high compression and yet permit ample valve clearance; it has a thick head and two narrow piston rings at the top, the lower of these rings acts as a scraper and returns oil direct to the gudgeon pin bearings, a shallow groove being machined round the piston on the gudgeon pin centre. Below the gudgeon pin boss the sides of the piston are cut away.

Split cone fixing employed for the spring cups on the o.h.v. Norton.

For this model a new frame has been designed, and though it follows the lines usually adhered to by the firm, the saddle position is both lower and slightly further forward than previously. In addition, adjustable footrests have been fitted and large head races. In order to comply with the law a large tubular expansion chamber is combined with the run of the exhaust pipe, the pipe being attached to the cylinder by a ribbed nut.

Other details include an internal expanding front brake mounted on a very stout hub with ⅜in. balls. Lubrication will be by a spring-fed hand pump without sight drip feed, 26×2¼in. tyres have been standardised, and the D-section mudguards are supported by flat stays.



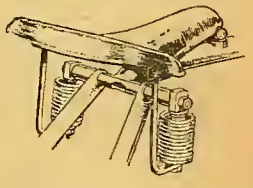
A semi-slipper alloy piston of unusual design is fitted to the latest o.h.v. Nortons.

On the side-by-side valve 490 c.c. model the most important changes are, to all intents and purposes, unnoticeable externally, since they affect the shape of the combustion chamber and ports, and have been made with the idea of increasing turbulence. The exhaust port and pipe, however, are somewhat larger and the valve stems are now parallel throughout their length, instead of having a shoulder as before. In addition, the popular 16H model will be supplied with wide flat mudguards, footboards and leg-shields as a full touring machine.

The "Big Four" is but little altered, but all Norton models, with the exception of the overhead valve type, will be fitted with a large expansion chamber under the magneto bracket and a long tail pipe passing rearwards.

NEW SINGLE GEARED COULSON.

FOR 1923 a light single geared model, engined with the 70×70 mm. Liberty two-stroke, will be a feature of the Coulson 1923 productions. It will follow standard Coulson lines in general lay-ont, but will not have the spring frame. 26in. wheels are fitted, and a direct-acting brake will operate in the rear belt rim. A Mills carburetter will be standardised.



On the 349 c.c. Coulson the saddle is attached direct to the frame.

Other Coulson models will be engined with the 349 c.c. side-by-side valve and the 548 c.c. Blackburne engines, and a 349 c.c. overhead-valve Blackburne sports model will also be listed. The specification of the two touring models will be very much alike, and will include, in addition to the well-known Coulson spring frame, a three-speed Burman gear with clutch and kick-starter and all-chain drive.

The frame has been shortened and cleaned up considerably, while the bearing surfaces for the links of the rear spring frame have been very much increased in proportions, and each pivot pin is now provided with a lubricator. In addition, the central stand has been dropped for a more normal type carried on the rear fork extension. Adjustable footrests are now used, and provision has been made for the fitting of a Magdyno without alteration to the normal magneto bracket.

The saddle, of course, remains as before, being attached direct to the frame members without the use of the saddle frame.

FRICTION-DRIVEN MINIATURE.

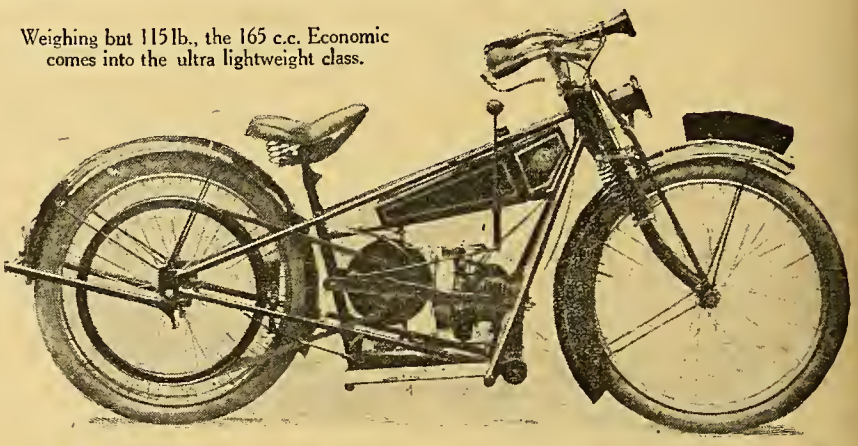
165 c.c. Economic Flat-twin Two-stroke; No Important Alterations.

WHEN it first made its appearance at Olympia last year the lightweight 165 c.c. Economic received considerable attention on account of its departures from standard practice. Its two-stroke flat-twin engine, friction drive, duplex frame, and really light weight, coupled with a very reasonable price, placed it in a class of its own.

Unfortunately, the 1923 price has not been settled, but it is to be expected that it will be well below the £34 charged last season.

Equipped with friction drive (having nine speeds ranging from 6 to 1 to 9 to 1) which incorporates a pedal actuated free engine, the control of the machine in traffic and on the open road is all that can be desired.

The petroil system is employed for lubrication purposes. Quite good performances have been made by the machine in 1922, one of the most noteworthy being a run from London to Edinburgh under A.C.U. observation in the running time of 22 hours 27 minutes, at an average speed of 17.02 m.p.h. The weight of the machine equipped for the journey was 115 lb.



Weighing but 115 lb., the 165 c.c. Economic comes into the ultra lightweight class.

It is not surprising, in view of the design of the Economic miniature, that few alterations have been made in next season's model. The finish, which for 1923 will be black and gold and improved in quality, and the fitting of the Capac single lever carburetter in future as a standard, will be the sole modification for next year. The flywheel magneto is provided with a separate lighting coil; giving an ever-ready source of current for the lamps when the engine is running.

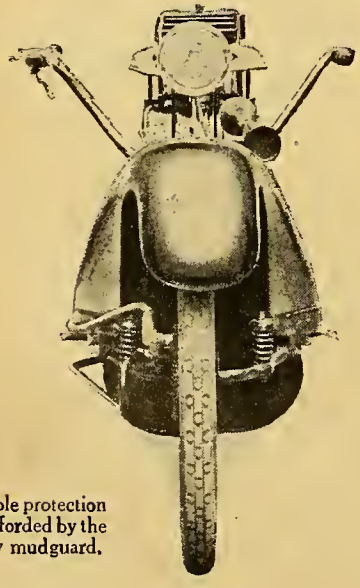
Economic motor cycles are made by The Eynsford Engineering Co., Ltd., Primrose Works, Eynsford, Kent.

ENGINE CAPACITY OF NER-A-CAR INCREASED.

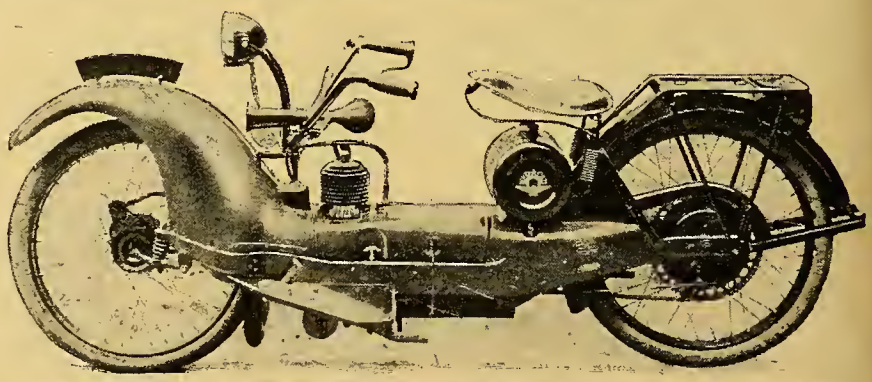
Many Detail Improvements to Wheels, Brakes and Control Mechanism.

WHILE there have been no radical alterations in the unique design of the Ner-a-Car there have been many detail changes tending to simplify the design which bring about real improvements not only in the production of the machine but in the provision of increased comfort for the rider.

To the average person, one of the greatest charms of the Ner-a-Car is the exceedingly neat way in which all the working parts are enclosed so that it may be used with the usual outdoor garments, overalls merely being necessary when overtaken by a drenching shower of rain.



Ample protection is afforded by the new mudguard.



Besides being fitted with a larger engine the new model Ner-a-Car has a neat chain guard, a switch adjacent to the engine for controlling the lights, a new headlamp mounting, and a conveniently disposed tool case at the rear of the carrier.

Further improvement has been made in the design of the front guard, which is composed of a single smooth sheet of beaten metal, has no visible stays, is so designed as to offer less wind resistance than the older type, and is so constructed that drops from the edges instead of being blown back on to the rider are carried away to the rear of the guard.

The engine has been considerably increased in size, being now 285 c.c. as against the 211 c.c. of last year's model (bore and stroke 70×74 mm.), but it remains of the standard three-port two-stroke type, with a finned exhaust port and a piston having three rings.

A Lodge plug with waterproof terminal has been fitted and from this the high-tension wire is carried to a special waterproof terminal situated in an accessible position forward of the flywheel magneto. In last year's model this terminal was exceedingly difficult to reach. The ignition apparatus itself has been considerably improved and strengthened.

Special care in silencing the machine has been taken, the silencer being redesigned and a long extension pipe has been fitted.

In order to withstand the roughest wear, the kick-starter on the 1923 model has been strengthened; its quadrant is

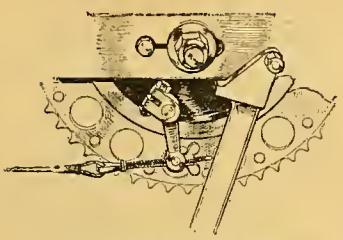
Advance Details of 1923 Models.—

mounted on an eccentric pin secured by a cotter pin, so that the meshing of the pinions can be adjusted.

An important improvement in the transmission is the fact that the friction disc is now made reversible, so that if one side becomes scored or worn the other side can be brought into use, while owing to the introduction of an ingenious spring-loaded plunger the change-speed lever is now self-locking and self-releasing in its quadrant.

Instead of two lamps fixed one each side of the mudguard a neat Powell & Hanmer head light is attached to the handle-bar stem; it derives its current from the flywheel magneto, while a dry battery carried underneath the saddle is provided for use while the machine is at rest.

Ball bearings are now employed at the top and bottom of the steering head, while the steering connections are now



A wing nut gives quick adjustment to the rear brake cable.

spring loaded. The front hub, also, has ball bearings on both sides, and a long swivel pin and a heavier housing are provided.

Formerly the front of the machine was suspended on springs and counter-springs, but the latter have been eliminated as the single springs fitted have proved to be adequate in every respect.

Improvement has also been brought about in the braking. There are now two internal expanding brakes of which the shoes are of aluminium, situated one each side of the rear wheel, one of these being actuated by the driver's left foot, while the other is controlled from the handle-bars.

A withdrawable spindle is fitted to the back hub, which incidentally has been strengthened and runs on two caged ball bearings.

So as further to strengthen and stiffen the pressed steel frame the cross member adjacent to the saddle has been fitted with large flanges.

A new tubular carrier, provided with eyelets for straps, will be fitted to the 1923 models. Front and back stands are provided, and 26×2¼in. tyres are fitted.

The weight is 190 lb. and the price £65.

The manufacturers of the Ner-a-Car are The Inter-Continental Engineering Co., Ltd., 20, Conduit Street, London

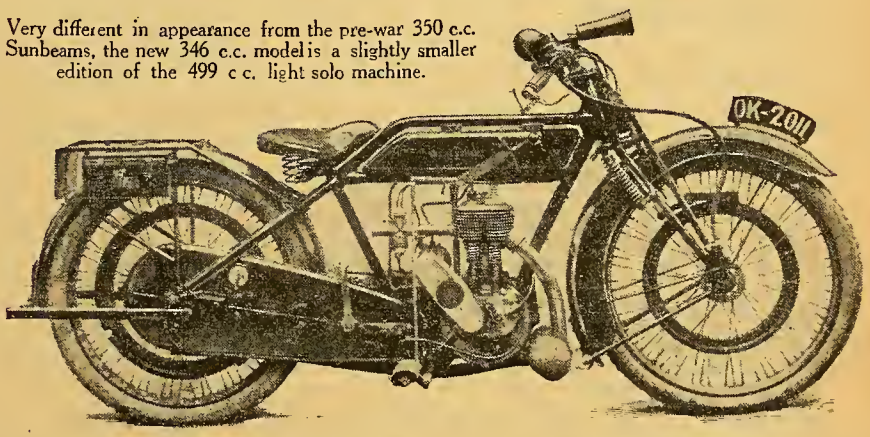
SUNBEAM LIGHTWEIGHT ONCE MORE.

Long-stroke 346 c.c. Model on Lines of the Popular 500 c.c. Machines.

GREAT interest will be centred in an important addition to the Sunbeam range. This takes the form of a 70×90 mm. (346 c.c.) machine. It will be remembered that in pre-war days the makers of the Sunbeam produced a most admirable 350 c.c. machine, and the re-introduction of an up-to-date representative in that class will be welcomed by a large number of riders.

Sunbeam lines are followed throughout in the new model, in fact, it is almost an exact replica of the 499 c.c. Sunbeam in miniature. So perfect are the proportions that one might easily mistake the new machine for the 499 c.c. light solo model if it were seen alone and not in company with the larger one. Not only are the lines similar, but many of the actual parts of the bigger machine are used. The gear box, for instance, is identical, parts of the timing gear are the same, and almost every detail which is altered has been modified only as regards weight.

Very different in appearance from the pre-war 350 c.c. Sunbeams, the new 346 c.c. model is a slightly smaller edition of the 499 c.c. light solo machine.



Iron or Aluminium Pistons.

A cast-iron piston having two top rings is fitted in the touring model, but the sports model will be provided with an aluminium piston.

A roller-bearing big end and ball-bearing main shaft are employed, the driving side having a double row race. The flywheels are steel stampings machined all over, and every detail is carried out in the well-known Sunbeam manner. It is probable, therefore, that (although the price is not yet available) the 346 c.c. Sunbeam will not be a cheap machine. In spite of this it should be very well worth the attention of those who are content with nothing less than the very best.

Large valves having inch and a half clear ports are used, and the cylinder, which is in one piece with the head, is on the same lines as its larger brothers.

The Sunbeam oil bath front chain case is, of course, a feature, while the rear chain is thoroughly enclosed and is lubricated by an oil release from the crank case.

A top gear ratio of 5.6 to 1 is supplied, and the tyre size is 26×2⅜in.

Following the lines of standard Sunbeam productions both wheels are fitted with internal V brake blocks working on dummy belt rims.

To comply with the law a large expansion box is fitted in front of the engine, though it is possible that modifications in this may be provided on the sports model. The magneto is carried behind the cylinder and adjustable foot-rests are fitted.

Modifications to Larger Machines.

With regard to the existing Sunbeam models, these remain to all intents and purposes unchanged. The 596 c.c. single has slightly improved cylinder head cooling, while an option of 3in. tyres is provided. In addition to this the carrier has been strengthened in order to take the Brooks B600 saddle if so specified.

The standard 499 c.c. model may also be obtained with 3in. tyres, and increased mudguard clearance has been provided to enable over-size tyres to be fitted.

In the case of the 499 c.c. light solo model, a large expansion box is an option, and again 3in. tyres may be fitted. In addition to this a compensating rear brake shoe is now used. The 492 c.c. T.T. single also has this compensating rear brake, while 26×2½in. tyres are fitted and an expansion box may be supplied to comply with the law.

THE LEVIS PROGRAMME.

THE makers of the justly popular Levis two-stroke machines have now announced their 1923 prices and list of models, which are as under:

	£
Popular model (211 c.c.), single gear, with sloping top tube	38
Model S. (211 c.c.), with 2-speed gear, clutch, and kick-starter	48
Model T. (211 c.c.), similar to model S., only with sloping top tube	49
Model H. (247 c.c.), 3-speed, all-chain, clutch, and kick-starter, sloping top tube	65

OVERHEAD VALVE A.J.S. AVAILABLE.

New 349 c.c. Model based on Famous T.T. Winning Type.

MORE than once criticisms have been heard owing to the fact that the makers of the A.J.S have repeatedly won the Tourist Trophy Race with an overhead valve model which was not available on the open market.

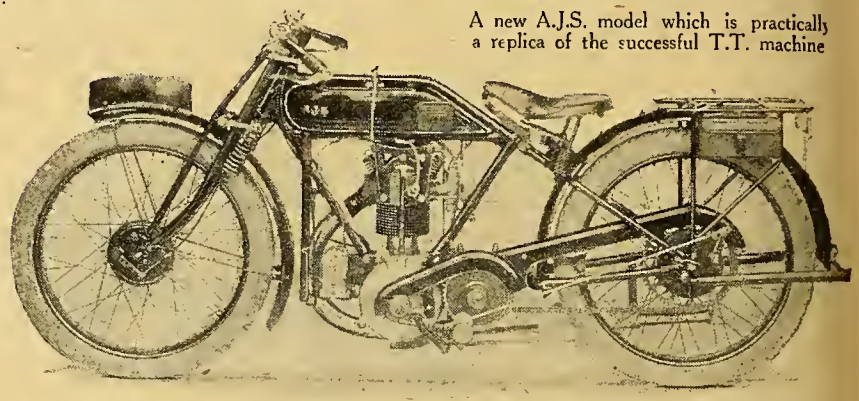
Nevertheless the manufacturers acted wisely, for they felt that until the experimental machines had been reduced to a form in which they were safe in the hands of the public it was better not to sell them broadcast. Now, however, the latest developments render the o.h.v. model as available as the popular side valve type.

At the forthcoming Olympia Show there will be staged a super sports model with an engine based on the T.T. A.J.S. machine. The overhead valve mechanism will be almost exactly similar, except for the fact that somewhat longer valve guides are employed so as to reduce wear at this vital point. These valves give a clear port opening equivalent to $1\frac{9}{16}$in. and a lift of $\frac{5}{16}$in. They are operated through hollow push rods with an independent return spring for the rocker gear. Recent modifications include an increased head cooling area with vertical fins arranged to lie in the same direction as the main air current. The detachable head is held down by a round section steel strap semi-circular in form. As might be expected, the head and cylinder joint are formed on the patented A.J.S. lines

Four-ringed aluminium piston.

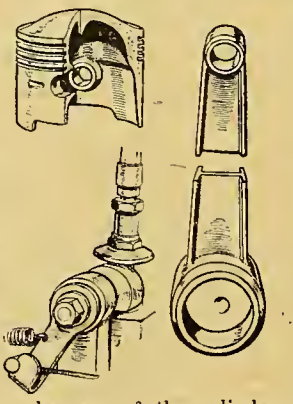
Another innovation since the Tourist Trophy races takes the form of an aluminium piston, though the four very narrow rings above the gudgeon pin are retained. A hollow gudgeon pin is fixed in the piston bosses by means of a split pin, a bronze bush being fitted to the small end of the connecting rod; the connecting rod itself is a nickel chrome forging, heat treated and machined all over. The section of the road is extraordinarily light, being no more than $\frac{1}{16}$in. thick in the web; in spite of this, no trouble has ever been experienced with it. Two rows of $\frac{5}{16}$in. rollers are employed for the big end, an outer race being pressed into the rod. The bore and stroke remain as before, 74 × 81 mm. (349 c.c.).

Plain splash lubrication is relied upon for the bronze main bearings. On the driving side of the crankshaft a standard spring loaded cam type of shock absorber is fitted, transmission following standard A.J.S. lines through a close ratio gear box, the ratios supplied being 5 to 1, 6.1 to 1, and 9.4 to 1.



A new A.J.S. model which is practically a replica of the successful T.T. machine

For the benefit of sporting riders who desire to enter speed events and hill-climbs, the rear mudguard and carrier have been made in a quickly detachable form. There is also a stay from the saddle tube to the rear of the cylinder head.



Top: Aluminium piston in the o.h.v. engine.

Left: Near external valve lifter cam.

Right: The roller bearing in the big end of the light connecting rod is carried in a pressed-in bush.

This overhead valve model does not replace the standard side-by-side valve machine, which will be listed as before, but with 650 × 65 mm. tyres, modified handle-bars and a much improved front mudguard which, in addition to being splayed at the rear, is formed with mud-trapping channels round the edge of the valances, and a shield at the front to prevent the ingress of air, which usually blows back mud spray on to the rider.

An aluminium piston is also fitted to this model.

Such features as the adjustable foot-rests, neat knee grips fixed direct to the tank, the spring loaded hand oil pump, are of conrse retained, and the machine is finished as well as ever.

Modifications to the 799 c.c. A.J.S. passenger outfit consist of aluminium pistons, a similar but enlarged type of mudguard to that employed on the standard 349 c.c. model, the fitting of Lucas Magdyno and lamps as standard, and the arrangement of the change speed lever and switchbox further forward on the tank, so that they clear the rider's knee with comfort.

1,234 c.c. INDIAN NEXT YEAR.

SO many British motor cycle manufacturers are introducing new lightweight models that this may be said to be one of the chief tendencies for 1923. Not so in America, however, where no new lightweights are being considered, but instead even larger machines than the big twins so familiar on our roads.

For 1923 the Indian range will be increased by the introduction in this country of a new model of 1,234 c.c., which will be known as the "Super-Chief." While new to the British market, this model has been very popular in the U.S.A. and overseas Dominions for the past year, and is intended for heavy duty and family sidecar work.

With a double seated sidecar of the Princess type, the price is £167, but if any big twin soloist desires an engine over 1,200 c.c., it will be available without the attachment at £137, with, like the sidecar outfit, full electrical equipment and speedometer.

Other Indian models retained for next year are: 998 c.c. Indian Chief, electrically equipped, £132; 998 c.c. Standard, spring frame, £107; electrically equipped, £123; 596 c.c. Scout, £96 10s.; electrically equipped, £113.

NEXT THURSDAY! THE MOTOR CYCLE **FIRST SPECIAL SHOW NUMBER.**

LIGHTWEIGHTS AND ACCESSORIES.

In addition to the well-known regular features which have made "The Motor Cycle" so popular with its 120,000 readers, many special articles are in course of preparation which will interest every motor cyclist and possess a strong appeal to all contemplating the purchase of a solo machine.

CURRENT CHAT

Times to Light Lamps.

Nov. 2nd	.. ..	5.1 p.m.
„ 4th	.. ..	4.57 „
„ 6th	.. ..	4.54 „
„ 8th	.. ..	4.51 „

One number plate must be illuminated as above *vide* Road Vehicles Registration and Licensing Order (1921). According to the Lights on Vehicles Regulations (1903) the lamps ordinarily required by law may be lit half an hour later.

Sunday at Brooklands.

Brooklands will be open on Sundays, free as usual, all through winter.

Armistice Day Brooklands Meeting.

Three motor cycle handicaps and three for cars will comprise the programme of the Armistice Day Brooklands Meeting. Entries are limited and close positively this morning.

Congratulations.

To H. Le Vack on his 5-mile record at over 100 m.p.h. we offer our congratulations, which are extended to the Zenith firm, the makers of the J.A.P. engine, and everyone concerned in the production of the first motor cycle to lap Brooklands at over 100 m.p.h.

A.C.U. Haven at Olympia.

Exclusive use of the Princes Rooms in Olympia has again been secured by the A.C.U. for the benefit of its members during the forthcoming Motor Cycle Show. As in former years, the Union will provide a special refreshment service, writing and cloakroom accommodation, and the use of a lounge.

Oil from Norfolk?

A petroleum drilling licence has been issued to a syndicate about to operate at Narborough, Norfolk.

THE MOTOR CYCLE

SPECIAL SHOW NUMBERS.

NOVEMBER 25th to DECEMBER 2nd marks the period when the

MOTOR CYCLE EXHIBITION

at Olympia will be open to the public.

In connection with the Show "The Motor Cycle" will publish four special issues as under:

Nov. 9th. Lightweights and Accessories.
Nov. 16th. Passenger Machines.
Nov. 23rd. Show Forecast and Guide.
Nov. 30th. Show Report.

Each of these enlarged issues will embody special features possessing a strong appeal to all who own or who contemplate the purchase of a motor cycle.

To avoid disappointment an order should be placed in advance with the local Newsagent.

EVERY THURSDAY....THREEPENCE

Special Features.

SPEED AND THE 10 FT. LINE.
MANY NEW MODELS.
OVER THE BURMESE HILLS.

Traps Again.

A police trap was in operation on a recent Saturday afternoon over a stretch of the Portsmouth Road between Kingston and Esher.

International Trials in Sweden.

The Swiss M.C.U. has definitely relinquished its right to organise the International Six Days Trials in Switzerland next year, and the Swedish M.C.C. has applied for permission to run the event in Sweden.

Club Dinner Novelty.

Most club dinners are much of a muchness. The Ealing Club, however, is considering a suggestion made by Prof. Low that its function should be a *diner-dansant*, with the tablts set around the dancing floor.

End-to-End on a Motorised Bicycle.

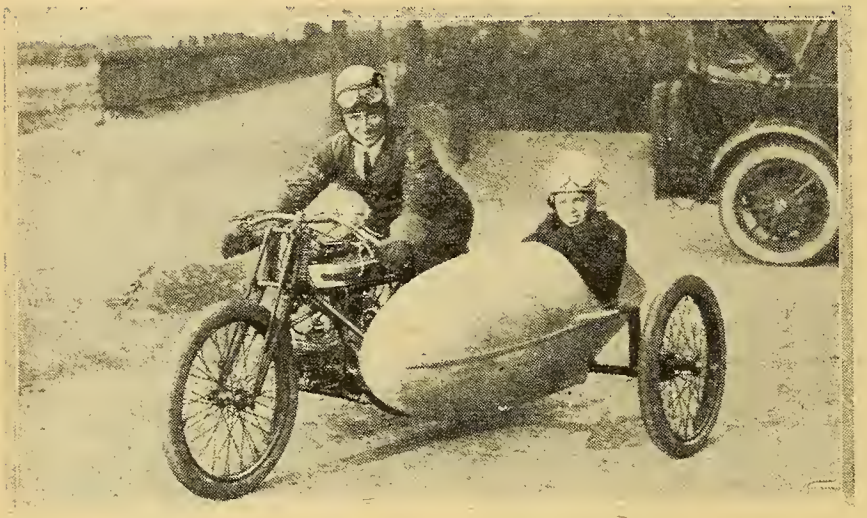
Under A.C.U. observation a standard stock McKenzie miniature has accomplished a run from Land's End to John o' Groats. The run is reported to have been highly successful. All hills except two in Scotland were climbed, and the rider finished in fresh condition, the only replacement during the whole journey being a sparking plug, which failed on Berriedale Hill. There were no tyre troubles, despite the bad conditions of the roads.

FROM END TO END. G. A. Cade and the little 169 c.c. McKenzie, on which he recently accomplished the run from John o' Groats to Lands End at an average speed of 18 m.p.h.

BIG ROAD IMPROVEMENT. Congestion on the London and Portsmouth Road will be considerably relieved by the new section between Portsbridge and Wymering, which was officially opened on Thursday last. The length is one mile and the width 40 feet. Nearly £40,000 has been expended on this improvement

ACTIVITY AT BROOKLANDS.

Short Distance Records by Two-stroke and Flat-twin.



C. G. Pullin and his various racing Douglas machines figure repeatedly in the record lists. His latest achievement, with the 496 c.c. outfit shown, is the breaking of international 500 c.c. mile and kilometre sidecar records at 75·74 and 78·34 m.p.h. respectively.

R. N. Judd (249 Velocette) proves from time to time that the two-stroke is capable of beating four-stroke times. 58·83 m.p.h. (standing kilometre) and 62·91 m.p.h (standing mile) are his latest figures.

IN addition to the five-mile record at over 100 m.p.h. secured by H. Le Vack on a Zenith-Jap, referred to on page 627, there were other activities at Brooklands on Friday last, not the least important being R. N. Judd's (249 Velocette) successful attack on the standing start kilometre and mile records.

Judd's new figures are :

Standing kilometre:			
38.02s.	58.83 m.p.h.	94.68 km.p.h.	
Standing mile:			
57.32s.	62.91 m.p.h.	101.24 km.p.h.	

These are British records, and the time for the standing kilometre also secures this record in class B, which had previously been established by C. Pullin on his 350 c.c. Douglas.

Cyril Pullin's attacks were on the international mean speed records. With a 57×68 mm. (350 c.c.) Douglas he established the following :

Standing kilometre:			
Normal 39.64s.	56.43 m.p.h.	90.82 km.p.h.	
Mean 40.00s.	55.92 m.p.h.	90.00 km.p.h.	
Standing mile:			
Normal 56.92s.	63.24 m.p.h.	101.77 km.p.h.	
Mean 57.77s.	62.53 m.p.h.	100.63 km.p.h.	

With a 68×68 mm. (496 c.c.) Douglas and sidecar Pullin's speeds were :

Flying kilometre:			
Normal 28.45s.	78.63 m.p.h.	126.54 km.p.h.	
Mean 28.55s.	78.34 m.p.h.	126.07 km.p.h.	
Flying mile:			
Normal 45.76s.	78.66 m.p.h.	126.58 km.p.h.	
Mean 47.52s.	75.74 m.p.h.	121.89 km.p.h.	

From the above standing start figures it will be seen that Judd's Velocette evidently scored above Pullin's 350 c.c. Douglas by its superior acceleration, for while it was 2 m.p.h. faster than the Douglas for a kilometre, the latter's speed for the mile was 0.33 m.p.h. greater.

Equipment.

Judd's equipment included Dunlop tyres, Speedwell oil, Binks carburetter, and Shell spirit, while Pullin used a Wex carburetter, Castrol oil, K.L.G. plugs, Hutchinson tyres, E.I.C. magneto, Renold chains, John Bull knee grips, Toronda sidecar, and Pratt's spirit.

"TRIPLE-EIGHT" RECORD BY RUDGE.

61·72 m.p.h. for Twenty-four Hours in Three Eight-Hour Periods.

OWING to the shortness of late October days it is not possible now to attempt a double-twelve record. Therefore J. H. Mathers and R. E. Dicker, riding a 998 c.c. Rudge, have done the next best thing by completing what may be called a triple-eight hours' run at an average of 61.72 m.p.h.

It is expected that the A.C.U. will recognise their attempt as a twenty-four-hour record breaking the double-twelve. A start was made on Wednesday of last week, when 525 miles 381 yards were covered in eight hours, an average speed of 65.51 m.p.h. The next day was too foggy to continue, and although the ride was commenced again on Friday the weather conditions were still unfavourable, reducing the distance to 423 miles 1,684 yards (52.97 m.p.h.).

Saturday was better, and 525 miles 381 yards were covered, equalling 65.65 m.p.h.

The total distance thus was 1,481 miles 459 yards, an average speed of 61.72 m.p.h., which, if recognised, just beats the existing Norton double-twelve figures.

A photograph of Dicker starting one of his spells of riding appears on p. 632.

FIVE AND TEN MILES SIDECAR RECORDS.

ON Saturday last, H. Le Vack, riding the identical Zenith-Jap machine on which he had performed so successfully the previous day, broke the flying five-mile and the standing ten-mile sidecar records. The weather was fine but exceedingly cold, and another rider who made an attempt on records was stopped by a frozen carburetter. Le Vack, however, had an exhaust-heated muffle on his induction pipe, and was not troubled. His standing lap was covered at the rate of 72.24 m.p.h., in spite of an excess of oil causing misfiring. Lap speeds improved consistently, and the last lap was the fastest. The same equipment as on the previous day was used, namely, Hutchinson tyres, Castrol R., Lodge plugs, M.L. magneto, and Perry chains.

Flying Five Miles: 3m. 40.24s. = 81.72 m.p.h.
Standing Ten Miles: 7m. 36.40s. = 78.88 m.p.h.

OVER 100 M.P.H. FOR FIVE MILES.

Le Vack and his Zenith-Jap First to Lap Brooklands at Over the Century Mark.

AT last a motor cycle has lapped Brooklands at over 100 m.p.h. On Friday of last week H. Le Vack enhanced his reputation as a leading British speedman by covering the flying five miles in 2m. 59.48s., which is officially recorded as 100.29 m.p.h.

A fine achievement. H. Le Vack and his 988 c.c. Zenith-Jap, on which he attained over a hundred miles an hour for five miles.

Le Vack's mount was a Zenith fitted with a J.A.P. engine of 988 c.c. (80×99 mm.), and was the same machine with which he secured the 1,000 c.c. championship on the previous Saturday.

This is the first occasion on which a British motor cycle has established a record at over 100 m.p.h., and the first time *any* motor cycle has lapped Brooklands at a figure over the century mark.

Le Vack was riding on the 50ft. line, while his speed was calculated on the 10ft. line, which means that his actual speed was about 102 m.p.h. Further, the weather was far from favourable, as a drizzling rain was falling.

Added interest lies in the fact that no "dope" was used, Le Vack's fuel being a half-and-half mixture of B.P. petrol and Anglo benzole.

When D. H. Davidson on a 998 c.c. Harley-Davidson attained the speed of 100 m.p.h. in April, 1921, the whole motor cycle world was surprised that what had hitherto been considered impossible had been accomplished. Then Le Vack on a 998 c.c. Indian raised this to 107.55 m.p.h.

The fact that the first motor cycle to accomplish 100 m.p.h. in this country was of American manufacture was a source of dissatisfaction among motor cyclists in general, for, as much as they may admire the American machines so well known in this country, they would naturally have preferred that the honour should have been won by a home production.

For long the Americans had held the reputation as the fastest machines on British roads for the reason that our manufacturers had not set themselves the task of improving the big twins to the same extent as the 500 c.c. and 350 c.c. types. Whether it was Davidson's and Le Vack's 100 m.p.h. records or not, the fact remains that, since they secured them, greater effort has been made to produce a really fast British big twin, with the eminently satisfactory result recorded above.

It was not many years ago when 60 m.p.h. was considered to be approaching the limits both of the track and the motor cycle, and only men with experiences of speeds between 80 and 90 m.p.h. can fully appreciate what 100 m.p.h. really means for man, machine, and equipment.

We understand that Le Vack's equipment included Lodge plugs, Castrol oil, Hutchinson tyres, and Perry chains.

What it Felt Like.

It is of interest to remark that Le Vack's own opinion is that he was never within an 80ft. line on this occasion.

Questioned afterwards as to what it felt like to lap at such a pace (which meant that the machine must have been doing fully 108 m.p.h. down the railway straight), Le Vack indicated that it was not the easiest thing in the world to hold the machine on a course. The surface of the track in places does not resemble a billiard table, particularly behind the aeroplane sheds, where a series of bumps set the machine bouncing alarmingly.

Down the railway straight the machine more or less steered itself, due in no small manner to the device for tightening the steering head at will which Le Vack has fitted. This eliminates the tendency for the front wheel to wobble when crossing inequalities in the track. (It is, of course, impracticable to have a permanently tight head, but the device referred to makes it possible to regulate the degree of stiffness by a touch of the finger while the machine is in motion.) Along the railway straight, in fact, Le Vack was able to remove one hand from the bars to alter the carburetter adjustment.

Banking Taken "Slowly."

The most "nervy" section of the track was the bend which commences by the kilometre box. The banking there, according to Le Vack, is too low to permit of it being taken without slowing after the tremendous speed attained down the straight. The machine simply would not keep down the banking at this point, and it was quite an effort to hold it on to what banking there is, even at a slightly reduced pace. Across the fork Le Vack steered his customary course, which brings him well under the lee of the Vickers shed, but there is a nasty bump higher up, and a detour had to be made in order to avoid hitting it.

Approaching the Members' Bridge the wind seemed to pile up, as from a funnel, and its force was sufficient to make the rider's eyes stream beneath his goggles, and to blur his vision dangerously. Passing under the bridge, Le Vack was within twenty feet of the top of the banking, and several hardened Brooklands habitués who watched him at this place said that the sight gave them "quite a turn." However, success crowned the J.A.P. exponent's efforts, and no one will grudge him his reward, for, together with his faithful mechanic Moran, he has worked early and late on his beloved engines. Possibly by the time these lines appear he will have lowered the kilometre speed record of 107.55 m.p.h. which he set up nearly a year ago. On his own statement, a limit of speed need not be discussed until 115 m.p.h. has been attained over the kilometre.

M.C.C. DECLINES A.C.U. AFFILIATION.

AT an Ordinary General Meeting of the Motor Cycling Club, held at Pagani's Restaurant last week, under the chairmanship of Mr. L. A. Baddeley, called to discuss affiliation with the governing body, an adverse decision was reached.

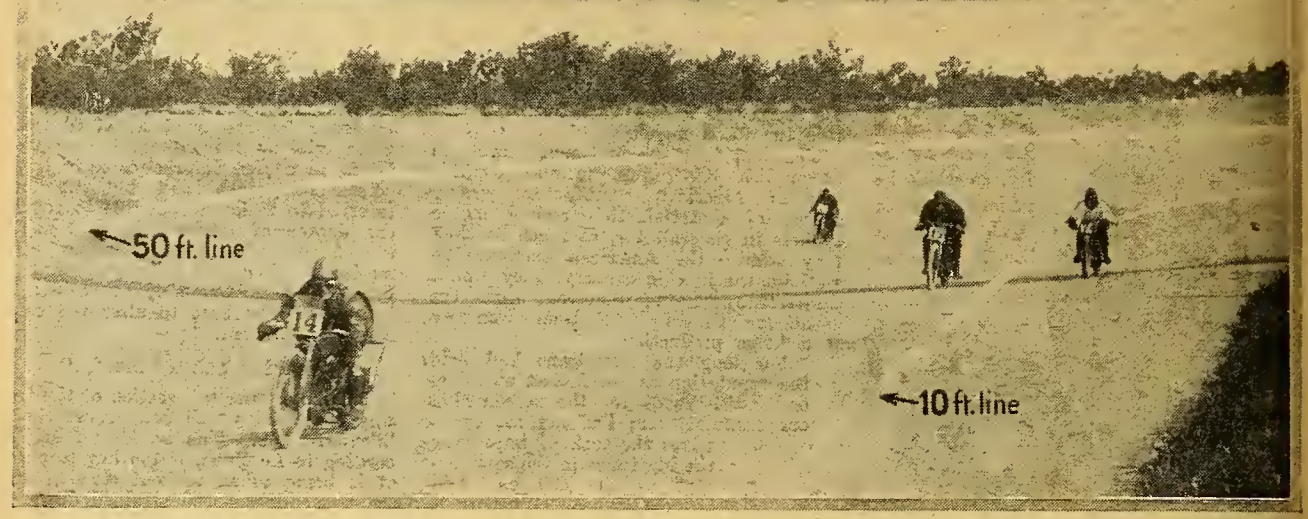
Next it was proposed that the club should give the Union its moral and financial support, but after a lengthy discussion it was finally decided to defer the matter until the M.C.C. Annual General Meeting in January.

Previous to the meeting last week, the members had been circularised, and asked to say whether they drove cars or motor cycles, whether they were interested in both vehicles, or whether they were affiliated to the Auto-Cycle Union. Some interesting figures resulted, and it was shown from the number of replies received, which clearly did not represent the full membership, that out of 95 car members practically half were affiliated; out of 199 motor cycle members only 50 were not affiliated; while out of 196 members interested in both cars and motor cycles only 60 were not affiliated. The final result of the referendum showed that 73 per cent. of the M.C.C. members were actually affiliated members of the Auto-Cycle Union.

Despite these figures the general feeling of the meeting was shown clearly at an early stage, and it was seen at once that the proposal to affiliate would be lost; it was quite easy to gather, however, from the views expressed by the majority, that no animosity was felt towards the A.C.U.

C O

Speed on the 10ft. Line



Why Car Speeds at Brooklands are More Favourably Calculated than Motor Cycle Speeds.

A MATTER that is agitating the minds of certain Brooklands riders at the present time concerns the rule decreeing that motor cycle lap times shall be converted into m.p.h. on the assumption that a motor cycle, no matter what its speed, adheres to a course within the ten-foot line, *i.e.*, within ten feet of the inner edge of the track. Speeds have, however, increased so tremendously of late that it is no uncommon occurrence for laps to be accomplished at an average of 90 m.p.h., and even 100 m.p.h.

Fast Machines Follow Car Tracks.

Now, it is held by many racing men—including Le Vack—that, when lapping at any speed in excess of 90 m.p.h., or with sidecar, at over 75 m.p.h., it is impossible to steer a course that is nearer to the inside of the track than the 50ft. line, on which all car speeds are calculated as a matter of course. Above a certain lap speed, these riders maintain, motor cycle speeds should be calculated on the same basis.

That this is not an idle contention will be admitted by most people who have witnessed a motor cyclist lapping at a really high speed. He must go fairly high up the banking—not only under the Members' Bridge, where the bend is most acute, but on the far end of the finishing straight, by the aeroplane sheds. When lap speeds approach the hundred mark, a considerable divergence is apparent between the speed credited for the 10ft. line and that for the 50ft. line.

The following figures show the differences when the lap times are around 100 seconds:

Seconds per lap.	Speed, m.p.h. 10 foot line.	50 foot line.
108	90.59	92.23
104	94.07	95.78
100	97.83	99.61
97	100.65	102.69

It will be seen that from 1½ m.p.h. to 2 m.p.h. is lost by the motor cyclist on account of the archaic insistence upon the 10ft. line calculation—a ruling made, be it noted, when a motor cycle that could lap at 60 m.p.h. was considered really fast.

To realise fully the absurdity of the present system, say the advocates of reform, consider the case of a match between a motor cycle and a car, both of which could lap in, for the sake of argument, 99 secs. According to the critics, both vehicles would of necessity have to follow approximately the same course, and so cover the same distance, yet the car would be credited with a speed of 100.61 m.p.h., while the unfortunate motor cyclist would have his lap speed worked out at but 98.82 m.p.h.

Matter to be Considered.

Already the B.M.C.R.C. has considered the problem, and a request has been made that certain trustworthy riders should take their machines, equipped with speedometer, round the course which they customarily follow when lapping at their highest speeds. It was intended that the distance so recorded should be compared with the 2.71767 miles which the official table gives as being the circumference of the track on the 10ft. line. Unfortunately, at speeds slow enough to obtain accurate speedometer readings, it is difficult to follow the course of a 90 m.p.h. racer.

Evidently, however, something should be done in the matter, and that soon, for all records of more than one mile distance are affected. A suggestion is that solo speeds over 90 m.p.h., and sidecar speeds over 75 m.p.h., should be calculated on the 50ft. line basis. It is certain, however, that if the 50ft. concession is allowed, future records will only be credited if they break the previous *time* and not merely the speed only.

CAMBRIDGE RAG ON ALMS HILL.

Chilterns Route followed in Cambridge University M.C.C. Sporting Trial. Record Entry.

DESPITE bitterly cold weather, no less than 46 competitors foregathered near Baldock on the morning of the 29th ult. for the Cambridge University M.C.C. sporting trial.

Considerably less than half that number returned to the finish at Hitchin with clean sheets, but, neglecting the ten non-starters, it was a record entry, and the event as a whole was a striking tribute to the enthusiasm of Cambridge for motor cycling; for every man was an absolute amateur.

There is very little scope for a sporting trial in Cambridgeshire, and consequently the course made a bee-line for the west and Alms Hill, embracing three minor climbs in the Chilterns *en route*.

Mixed Hill Climbing.

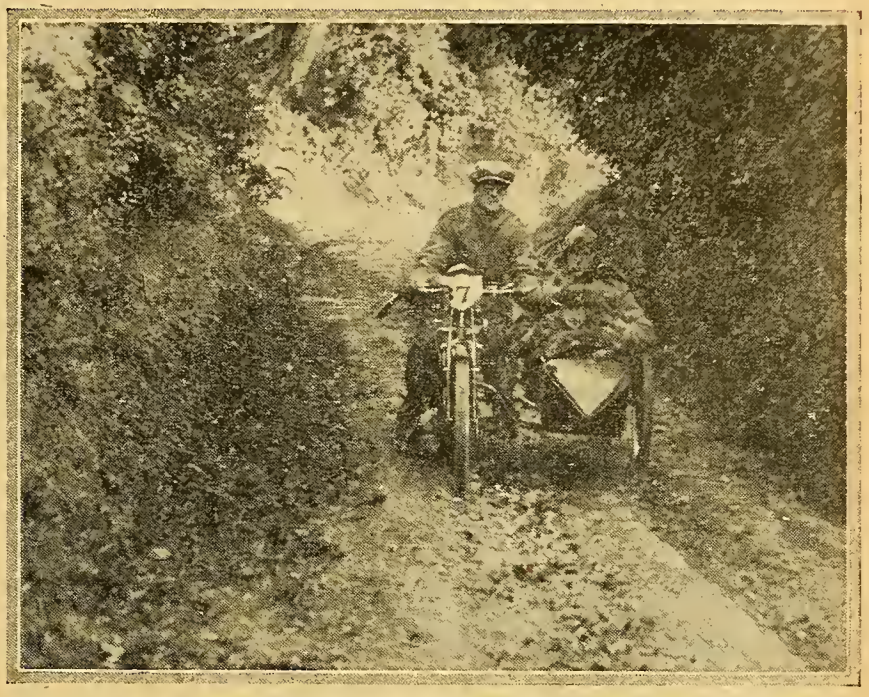
The worst of these, Nettleden, is in the ordinary course of events a second gear climb, but not all the entry had three-speed boxes, nor were all the machines in perfect tune and of modern design. Two 349 c.c. Douglas riders, V. N. Malcolm and R. C. Jebb, failed and pushed to the top, and A. H. Wheeler on a single-geared Peugeot stopped half-way up and turned back. E. W. T. Howard (492 Sunbeam) made possibly the best solo ascent, although two Scott riders might have eclipsed him had they not foolishly bunched themselves with some plodding singles.

A 20 m.p.h. timed climb of Waterworks Hill, near Tring, was relieved from dullness by a surprise acute hairpin bend a few yards from the start, and S. P. Patel (550 Triumph sc.) was reported to have failed altogether here.

Alms came after lunch at Henley, and, although it was optional, almost everybody had a shot at it. About half of them got up non-stop.

The hill was bone-dry, and a good many of the failures were obviously caused by sheer fear of finding it in its notorious state of "impossible" wetness.

Easily the four best solo climbs were made by E. W. T. Howard (492 Sunbeam), D. McLeod (490 Norton), O. C. H. Giddy (349 A.J.S.), who coolly came back half-way down to see the fun for five minutes, and G. E. Kann (698 Raleigh).



One of the best performances in the trial was made by O. G. Smart (490 Norton sidecar). Smart climbing the first and easiest hill at Gaddesdon.

Not very far behind, but some of them looking rather worried, were: G. W. Warner (349 Massey-Arran), E. R. Hill (490 Norton), R. H. Bury (490 Norton), J. A. Orr (499 Sunbeam), H. M. Chalmers (498 Zenith-Bradshaw) — a Gradua gear model with limited low gear—A. J. Morris (Sunbeam), and W. A. Charnock (Coventry Victor).

The smallest engined sidecar, O. G. Smart's 490 c.c. Norton outfit, was also the only successful one, but it was noticeable that five out of eight four-wheelers failed completely.

L. A. Humphreys (557 B.S.A.) slogged vigorously on the steepest part, and D. S. Redman (481 Scott Squirrel) shot up the worst portion to come to a sudden stop near the top.

The unsuccessful solo machines were: Trump-Jap, 550 c.c. Triumph, 348 c.c. Raleigh, 349 c.c. Douglas, 492 c.c. Sunbeam, Rudge-Multi (very poor attempt), and Scott (ditto); and the sidecars: 770 c.c. B.S.A., 800 c.c. A.J.S., and 499 c.c. Sunbeam.

The trial ended here as far as hills were concerned—there were four more observed climbs, but none of them worthy of the compliment—but the weather now took a hand. Biting sleet began to fall, and with the approach of darkness the return 60-mile journey was anything but pleasant.

The later members were particularly unfortunate, for the start in the morning had been delayed to 10.15 a.m., and they had nearly two hours of route finding in the dark—not easy work, despite the very excellent arrowing arrangements.

OPEN HILL CLIMB IN THE NORTH.

FINE weather, good organisation, and high speeds all combined to make the North-Western Centre A.C.U. open hill-climb held last Saturday a great success. The course selected was a perfectly straight and well-surfaced hill, 680 yards in length, known as Stricken's Lane, situated between Garstang Station and Oakenclough.

Among the best performances were those of R. T. Cawthorne (490 Norton) and P. Baron (348 Hawker). The latter rider secured a large number of firsts, his performance being the more remarkable in view of the fact that he is a heavily-built man. Results (unconfirmed):

250 c.c.—1, B. Kershaw (249 New Imperial), 28⅕s.; 2, J. Bennett (244 Dalton), 32⅘.

250 c.c. (EXPERT BARRED).—1, B. Parkinson (249 Diamond), 33⅕s.

350 c.c.—1, P. Baron (348 Hawker), 23⅘s.; 2, R. Watts (348 Dot), 25⅖s.

350 c.c. (EXPERT BARRED).—1, P. Baron (348 Hawker), 24⅖s.; 2, B. Watts (348 Dot), 25⅖s.

500 c.c.—1, R. T. Cawthorne (490 Norton), 21⅗s.; 2, W. Johnson (492 Sunbeam) and C. Dodson (492 Sunbeam), 24⅕.

500 c.c. (EXPERT BARRED).—1, C. Dodson (492 Sunbeam), 24s.; 2, S. Buckley (490 Norton), 24⅘.

750 c.c.—1, R. T. Cawthorne (490 Norton), 22⅕s.; 2, C. Dodson (492 Sunbeam), 24⅗s.

750 c.c. (EXPERT BARRED).—1, T. Spann (492 Sunbeam), 24⅕s.; 2, C. Dodson (492 Sunbeam), 24⅖s.

1,000 c.c.—1, R. T. Cawthorne (490 Norton), 22s.; 2, W. Lord (492 Sunbeam), 24⅘s.

1,000 c.c. (EXPERT BARRED).—1, C. Dodson (492 Sunbeam), 24s.; 2, A. Tinkler (999.5 American X), 24⅕s.

UNLIMITED.—1, R. T. Cawthorne (490 Norton), 22⅖s.; 2, C. Dodson (492 Sunbeam), 24s.

UNLIMITED (EXPERT BARRED).—1, C. Dodson (492 Sunbeam), 23⅕s.; 2, A. Tinkler (999.5 American X), 23⅘s.

500 c.c. SIDECARS.—1, R. T. Cawthorne (490 Norton sc.), 25⅘s.

500 c.c. SIDECARS (EXPERT BARRED).—1, C. G. Bullough (490 Norton sc.), 27s.

750 c.c. SIDECARS.—1, R. T. Cawthorne (490 Norton sc.), 25⅘s.

750 c.c. SIDECARS (EXPERT BARRED).—1, C. G. Bullough (490 Norton sc.), 27s.

1,000 c.c. SIDECARS.—1, R. T. Cawthorne (490 Norton sc.), 25⅕s.

1,000 c.c. SIDECARS (EXPERT BARRED).—1, C. G. Bullough (490 Norton sc.), 27s.

UNLIMITED SIDECARS.—1, R. T. Cawthorne (490 Norton sc.), 25⅘s.

UNLIMITED SIDECARS (EXPERT BARRED).—1, C. G. Bullough (490 Norton sc.), 27s.

Fastest time of the day was made by Cawthorne, who covered the course in 21⅗s.

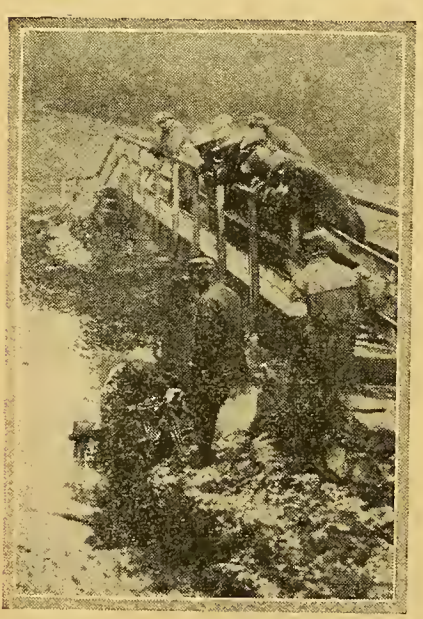
"BOGEY PERFORMANCES."

New System of Marking Introduced in Yorkshire Centre A.C.U. Reliability Trial.

ORGANISED by the Ilkley M.C. and L.C.C. the trial held last Saturday received very indifferent support from the clubs forming the Centre, only 16 competitors starting, seven of whom rode Scott machines.

Why this trial did not appeal to the ordinary rider is a problem difficult to solve. Quite a goodly array of trophies (five in all), along with the usual medals, were offered for competition. The route was only 120 odd miles in length and did not include any freak hills.

It may be that the new system of finding a winner by the inclusion of "bogey times" in place of the usual observer and his marks acted as a veritable bogey. If so it was very unfortunate, for this new system appears to work very well. The idea is really a system of handicapping, different classes of machines having to cover short difficult sections of the course in times which are known and which may be less or slightly more than the schedule speed of the event; such sections are not non-stop, in fact a rider may fail or fall off on a hill or stop for a swim in a watersplash without any penalty whatsoever provided he completes the section at or within his bogey time, marks of course being lost for being late.



W. Clough endeavours to take his 532 c.c. Scott under the bridge at Mogington.

E. Eggers (right), winner of the Ilkley Trophy and prize for the best performance of the day, crossing Mogington watersplash on his 349 c.c. A.J.S. in company with a Sunbeam rider.

Snow was on the ground in the morning, but brilliant sunshine was overhead; soon, however, the weather changed, and snow and sleet showers, accompanied by a cold north-easterly wind, faced the riders for the rest of the day.

Mogington watersplash proved of some interest and amusement. W. Moore (532 Scott) came off in the mud before entering the water. W. Clough, also on a Scott, and W. Smith (492 Sunbeam) both tried to go down stream, but were saved by a friendly mud bank, and L. A. Runton (998 Indian) hit the bank and stuck. E. L. Boston on a Scott undoubtedly made the best solo performance and W. Lister (Scott sc.) proved the best passenger machine driver.

Next came West End Bank, which was approached by a gate at the extreme bottom, but even this added trouble caused no anxiety on this once dreaded hill. Unfortunately both private owner passenger machines which continued running after the lunch stop had trouble. Lister with punctures and J. W. Wilkinson (496 Douglas sc.) ran off the course and finished late. The results are as follows:—

Ilkley Trophy (best performance, trade or amateur): E. Eggers (349 A.J.S.).
Scott Trophy (best amateur solo): H. S. Moorhouse (550 Triumph).
Triumph Trophy (best trade solo): H. Langman (532 Scott).
Palmer Trophy (best trade passenger): W. F. Scott (532 Scott sc.).
Olai Trophy (best amateur passenger): not awarded.

CHESHIRE GOES TO DERBYSHIRE.

ONLY formed recently, the Cheshire Centre A.C.U. held its first open reliability trial on Saturday, the 21st October, for the Walker Silver Cup.

It was decided before the start to abandon the idea of holding a petrol consumption test owing to a considerable number of the competitors having no means of sealing their tanks.

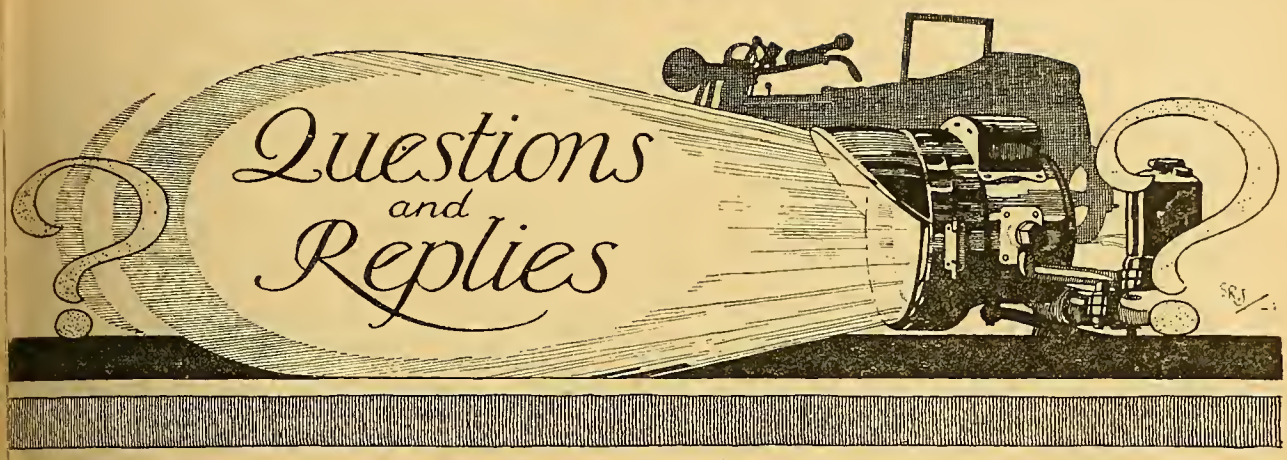
Mow Cop was the first hill, but it was in very good condition and so accounted for but few failures, the unfortunates being Z. Gilmour (Connaught) and J. Hopwood (B.S.A.); several, however, were guilty of using their feet.

With these exceptions the performances were uniformly good, and it was difficult to distinguish the most meritorious climbs. S. A. Crabtree, who was riding his T.T. Sunbeam, was fast, as also were A. Greenwood's Brough Superior, L. Randle's Sunbeam, B. F. G. Fowke's Beardmore and Graham Oates' 249 c.c. Grindlay. J. W. Moxon (Monopole) climbed very steadily.

After travelling a short colonial section following Mow Cop, some considerable difficulty was experienced in following the course, but most of the competitors checked in to time at the lunch stop at Leek.

The famous Litton Slack was very kind to the competitors, for the surface was in fine condition. Nevertheless a number failed. Crabtree (Sunbeam) was hopelessly over-geared, and was prevented from rushing it by a stationary sidecar. Other failures were C. A. Clarke (Sunbeam), whose engine seized when he learn wanted it to, S. B. Clegg (Morgan), C. Kirkham (Rudge), and H. Jacques (Harley-Davidson).

The best climbs were made by R. I. Devonport (G.N.), J. W. Moxon (Monopole), L. Randle (Sunbeam), C. Guthrie (Raleigh), R. C. Bennett (Federation), Graham Oates (Grindlay), and Miss M. Cottle (Powell).



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality

DIFFICULTY WITH A REPLACEMENT PISTON.

A new piston which is heavier than the old one has been fitted to my 1911 Triumph and now the machine knocks when running, becoming very bad at 20 miles an hour. The bearings are in order. Is this caused by the heavier piston?—H.P.

The increased weight of the piston could not cause knocking; probably what has happened is that the compression ratio has been increased owing to the new piston being higher from the gudgeon pin to the top, thus diminishing combustion space, or even, maybe, at the bottom of its stroke the new piston is pulling the top of the crank case, if it is a shade too long; this trouble might not make itself apparent until a fairly high speed is reached.

STARTING A SCOTT.

The machine I ride is a 1921 Scott and it has never been an easy starter. Recently, however, I have experienced more than the usual difficulty in getting the engine to start from cold. I have fitted a Cox-Atmos carburetter, in the hope of an improvement in starting, and I have carefully checked the ignition timing and changed the plugs, all without avail. Quite good sparks can be produced (in air) by working the kick-starter, and I believe the ignition is quite in order. I have looked for air leaks in the induction system, but cannot trace any. The machine is in new condition, having done about 1,000 miles.—A.J.

If you are quite sure that all the joints are tight (note specially that the induction pipe is really firm on the crank case stump), starting should be a matter of ease. It is advisable, however, to fit compression taps in the cylinder heads, or in one of them at any rate, and start up as follows:—Inject a small quantity of petrol into the heads, well flood the carburetter, close the starting shutter, half lift the half compression valve lever on the left handle-bar, very slightly open the throttle, advance the spark almost fully. Use the kick-starter very gently indeed, just turning the engine over once or twice to free the pistons, then give one sharp dig with the starter, and the engine should fire immediately. Perhaps the easiest method of starting the Scott is to place the machine on its stand, and stand with one's back to the front of the machine, placing the right hand on the half compression lever, the right foot on the pedal, and the left hand on the saddle of the machine or the carrier for steadying purposes. Do not kick the starter; feel that the ratchet teeth have properly engaged, and feel the resistance of the engine before depressing the starter pedal fully; kicking the starter will inevitably break the ratchets.

TWO-STROKE CARBURATION.

Although my 269 c.c. two-speed Chater-Lea two stroke Villiers engined machine runs fairly well, I do not think I am getting full power or sufficient m.p.g. The carburetter is an Amac; the engine does not get sufficient air, as with the throttle almost shut and the engine just ticking over, it takes full air. I have tried it with the air cap removed, but it makes no difference. I am using a 26 jet. I have tried a 24 jet, but it popped back in the carburetter. I have tested the valve slides and they are working all right. Will you advise?—W.T.

As you do not tell us the consumption which you are getting with your machine, we are unable to advise you whether it is normal or not. At any rate, you should

Important Dates.

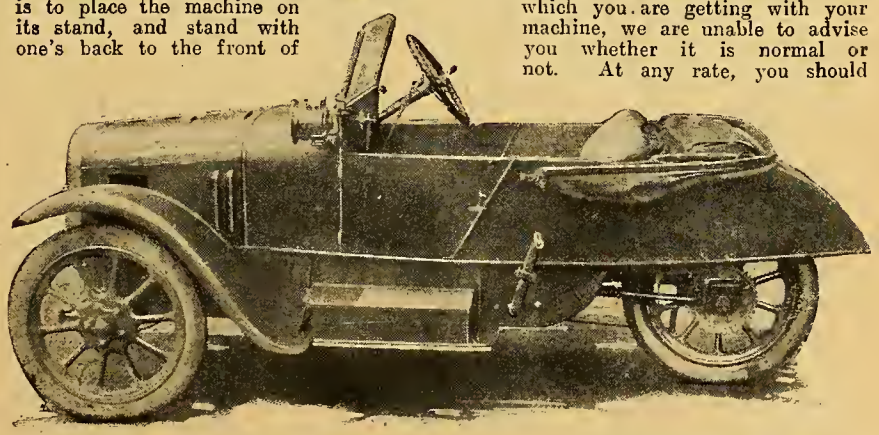
Fri., Nov. 3rd, to Sat., Nov. 11th—Olympia Car Show.

Sat., Nov. 25th, to Sat., Dec. 2nd—Olympia Motor Cycle Show.

Tues., Dec. 26th, and Wed., Dec. 27th—M.C.C. London-Exeter Run.

Sat., Jan. 13th, to Wed., Jan. 24th (1923)—The Belgian Salon.

Fri., Jan. 26th, to Sat., Feb. 3rd (1923)—Scottish Motor Show.



Detail improvements in chassis and bodywork will be found in the 1923 L.S.D. three-wheelers. This, the Family model, has a dickey seat for two children.

be able to get at least 80 m.p.g. with your machine. Make quite sure that the level in the carburetter is not too high; it should be set so that there is barely 1/16in. of up and down play between the float and the split pin on the float needle. If you get popping back with a 24 jet it indicates clearly that with this size the mixture is too weak. A variable jet adapter would facilitate carburetter tuning. The Amac carburetter is intended to work almost automatically, and on many machines the best setting is arrived at when full air can be given at all throttle openings once the engine has started. An extra air inlet on the induction pipe might help matters.

IMPULSE STARTERS.

[?] Not long ago I read in one of your issues a description of an impulse starter which, so far as the magneto is concerned, seems to assure a good spark at the correct time. However, it takes more than the spark to make the engine go, and what I would like to know is whether the one slow pull of the starting handle creates sufficient vacuum in the induction pipe to draw into the combustion chamber the gas required to start the engine. I am told that this is where impulse starters fail.—D.W.

Providing the engine is in good order, *i.e.*, that the piston rings are in good condition, that there is no leakage at the valves and valve guides, and that the induction pipe joints are tight, one or two of the slow pulls of the starting handle should induce a good starting mixture. Even if this were not so, easy starting could always be effected by giving a small injection of petrol into each cylinder. The idea of the impulse starter, of course, is to give a powerful spark at the plug irrespective of the speed at which the engine is being rotated. Moreover, the device causes the spark to occur after the piston has passed top dead centre, thus eliminating altogether the dangers of a back fire.

MECHANICAL NOISE.

[?] My 293 c.c. single-cylinder machine has lately developed rather an annoying rattle, which appears to come from the valves. I have had the cylinder off and decarbonised it. There is no up-and-down play in the big end, but a little side play. It is fitted with ball bearings to the big end; are they adjustable? I have also had the timing gear cover off, and there does not appear to be any wear in the mechanism. I might add that I have only had the machine four months, and have run about 1,000, so there should be no wear yet. I have been particularly careful about lubrication, and if anything have over-oiled. Can you enlighten me on the matter?—A.L.F.

Ball bearings are not used for motor cycle big-end bearings, and yours, no doubt, has a roller bearing; these are not adjustable. In all probability the noise is due to an excessive amount of play in the teeth of the timing gear wheels (backlash) or to excessive tappet clearance. Small four-stroke engines are apt to be mechanically noisy. Some advantage may be gained by enclosing the valves and tappets in covers, but you might have to devise these yourself, as, although such fittings have been made from time to time, it is not certain that you would get the correct thing to suit your particular engine.

TWENTY-FOUR HOURS SPEED TEST. During the middle of last week R. E. Dicker, riding a 998 c.c. Rudge, carried out a prolonged speed test under A.C.U. control. His object was to complete three eight-hour periods of riding at the highest speed his machine would maintain. Throughout the three days involved the machine was under official observation.

EXPERIENCES WANTED

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

"R.H." (Ascot).—McKenzie Light weight: vibration, reliability.

"W.A.M." (Kidderminster).—Det crank case breather on 348 c.c. Douglas.

"R.T.S." (Rushden).—Carden, 1921 a 1922 models: speed, hill-climbing, te dency to two-stroke, lubrication.

"J.D." (Peebles).—749 c.c. James sid car: silence, smooth running fuel co sumption, hill climbing.

"J.P." (Stretford).—348 c.c. Dougl 1913 model: speed with and without p lion passenger, petrol consumption, pric of welding damaged cylinder for t machine.

"H.W.M." (Thornton Heath).—348 c two-speed Douglas and light sidec climbing.

"H.K.R." (Manchester). — 499 c Triumph: tractability in traffic, val noise, climbing, speed.

SPARKLETS.

Selling J.D. Lightweights.

Mr. H. U. Smytheman, formerly w the Ivy Co. and later with Maude's Mo Mart, is to handle the sales branch of t J.D. lightweight.

Wrong Number.

Owing to confusion in numbers on observer's part, Graham Oates (Gru ley) was reported as having failed Bodfari Station Hill in the Reliance C Trial. Actually he did not even to with his feet.

Manufacturer's Clearance Sale.

New 1922 Rudges are being sold by manufacturers at considerably redu prices, ranging from £60 for the mo gear model to £93 10s. for the three-sp big twin.

What's in a Name?

By a curious coincidence a Camp sidecar outfit, driven by I. Cohen, v the Campion Cup, awarded by the N tingham Club in the recent East Midl Centre trial.

Youthful Speedman.

Aged only 16, W. Johnson, jun., a s cessful Southport rider of a Sunbeam, gained fourteen first or second pl during the last three months.

Continental Success.

To the many Triumph successes on Continent this season must now be ad the championship of France in the c.c. touring class. This has just b gained by Mons. G. Pinney on a 499 Triumph.

Autumn Trial Echo.

A. R. Edwards (247 Levis) is s stated to have made a clean ascent Flagstaff Hill in the Sutton Coldfi and North Birmingham A.C. trial h on the 14th ult.

OSMOND JUNIOR

THE PERFECT MOTOR ASSISTED CYCLE.

26 GUINEAS.

Power Unit 1½ h.p.
Approximate Weight 70 lbs.

"Sirs,
I have been using my machine since last summer, and find it most useful. I have been a cyclist all my life—am now 70—and thought that on account of these hills my cycling days were past, but with the "Simplex" Engine that difficulty is overcome, as I can negotiate most of these hills."
The Right Rev. BISHOP ANDREWS, D.D.

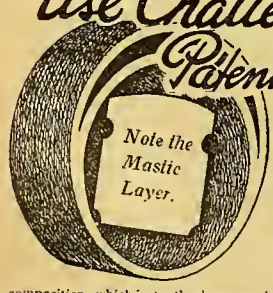
Use Challenger Patent Puncture Sealing Tubes



For Pugnacity, no other Tube can compare with the famous Challenger. It will knock out the Puncture Fiend in the first round and relieves the rider of all puncture worries.

They are absolutely pneumatic throughout and contain no messy or sticky substances, nor is there any solid filling, nor anything which will collect in a lump in the tyre while the car is standing.

The only difference from an ordinary tube is that the tread portion is very slightly thicker and is built of three layers so adjusted as to be self-sealing; the centre layer being composed of the patent hole-proof composition, which instantly closes up when the nail or article causing the puncture is withdrawn.

Price List:	24 x 2 14/3	26 x 2½ x 2¼	18/0	28 x 3	20/3
	24 x 2¼ 15/0	26 x 2½	18/0	650 x 65	20/9

THE 2½ h.p.

CALTHORPE

LIGHTWEIGHT

The most reliable and economical Two-Stroke in the world.

So devoid is this 2½ h.p. Calthorpe model of unnecessary complications that there is nothing which can become deranged beyond the powers of rectifying by the merest novice. Its engine is the simplest of two-strokes, properly lubricated by a patented system, and although no gears or clutch are fitted it will climb any ordinary hill with ease. Petrol averages 135 m.p.g.

DOUGLAS SPARES

I guarantee to send any part by first post; being on the spot, if it is not in my huge stock I obtain the same day. Try my return post service.

A FEW SPECIALITIES for your convenience. Filler, Funnel and Compression Reducer combined for 4 h.p. Douglas. The original patent. Permits the last drop of oil to be got out of the can. Sump refilled without soiling the hands. Fitted in 5 minutes, substantially made, and lasts a lifetime, **10/6.**

20% POWER INCREASE. Get more power from your Douglas by fitting **IMPROVED CYLINDERS.** They have stream-lined ports, larger fins and more of them. If you have a 1912-1921 model try them and you'll be surprised. For 2¾ h.p. Douglas, price **50/-** per cylinder. For 4 h.p. Douglas, with detachable heads, so that you can decarbonise your engine and overhaul your valve seatings without dismantling your engine, **65/-** per cylinder.

TWIN RINGS. Two rings in each groove give more power—perfectly gas-tight joints—prevent carbonising, as oil cannot pass them—wear indefinitely—need no running in. For 2¾ h.p. Douglas **1/6** each. 4 h.p. Douglas **1/8** each. Williamson, Sunbeam 2¾ h.p. and Humber twin, **1/8** each. Sunbeam, 4 h.p. All Blackburn 4 h.p. engines, Triumph, Coulsoo, Sheffield Henderson and Wilken 4 h.p. B.S.A. 3½ and 4½ h.p. Rudge, Singer 3½ h.p., New Hudson, L.M.C., J.A.P., 8 h.p. A.J.S., etc., **1/0** each. Other makes quoted for on application.

ZOOM : ZOOM ! ! The fashionable and efficient exhaust system. Adds pounds to the appearance of any Douglas and lets the engine give off its full power. In beautifully burnished copper, price **30/-**. In burnished nickel, price **33/6.**

THE TONY COMBINED ALUMINIUM FOOTBOARD AND FOOTRESTS. Beautifully finished—giving a natural riding position. A real solid cast job. Something that lasts for ever. Price **30/-** per pair complete

THIS BEAUTIFULLY-SHAPED PAN SADDLE with adjustable springs gives you a low natural riding position and does not foul the sidecar stay. My price **25/-**. Usual price 35/-.

THE CORAM PISTON, fitted with radiating internal fins. Correctly designed, much lighter yet stronger than standard. Fitted with the patent twin rings in one groove. Complete with rings and gudgeon pin. Price **29/-** per pair. Insist on having these fitted when your mount is next down, and you'll never regret it.

CORAM'S PATENT COMBINED ALLOY VALVE CAP. My latest idea. Never blows out, never seizes in the threads. Prevents knocking and overheating. A real boon. For 2¾ h.p. and 4 h.p. Douglases. Price **4/-** each. Cash or Terms.

W. G. Coram

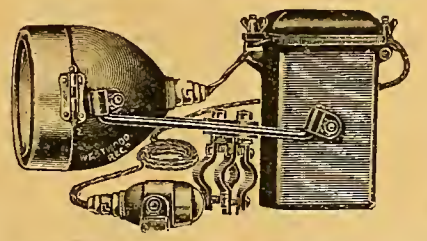
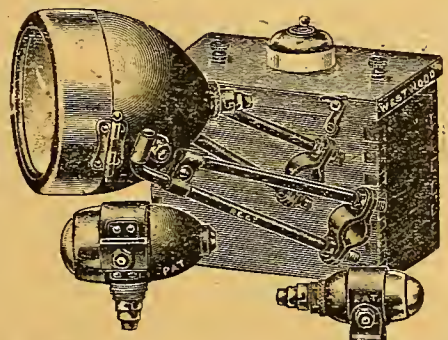
"DAYBEAM" Electric Solo Set



The Headlamp supplied with this set is our 5in Daybeam, a very powerful light-giver. The brackets are of exceptionally strong and handsome design. They carry the headlamp and also the (die cast) aluminium case. The accumulator is specially made for motor cycle lighting, and will brilliantly illuminate the head and the rear lamp for 20 hours if used intermittently. The tail lamp (our torpedo S.B.C.) is exceptionally strong and well made, and has a very attractive appearance. Each lamp is fitted with a switch, and one lamp may be used independently of the other. The outfit is despatched completely assembled, and 4 volt bulbs are fitted. The finish is ebony black and nickel plate.

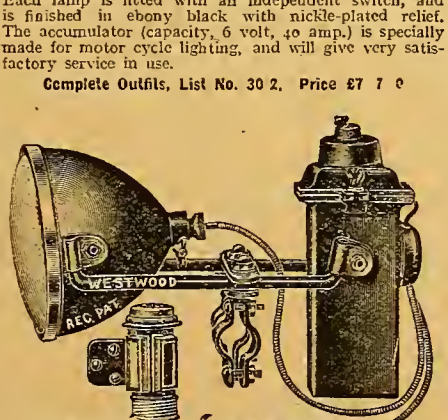
Complete Outfit, List No. 30 1, Price £5 5 0

"DAYBEAM" Combination Set



The set comprises Daybeam 7in. Headlamp, Ideal Sidecar Lamp, and Torpedo S.B.C. Tail Lamp. Each lamp is fitted with an independent switch, and is finished in ebony black with nickle-plated relief. The accumulator (capacity, 6 volt, 40 amp.) is specially made for motor cycle lighting, and will give very satisfactory service in use.

Complete Outfits, List No. 30 2, Price £7 7 0



"DAYBEAM" Complete Electric Set for Lightweighls

Solo Outfit, £3 3s.
Combination Outfit, £3 15s.

MIDDLETON'S Spring Wheel Sidecar again wins Championship at Brooklands, making third successive year. Le Vack (Zenith-Jap) first, O. de Lissa (Motosacoche) second.

MIDDLETON'S Spring Wheel Sidecar again used for records. 50 miles, 100 miles, one hour, by Messrs. Temple and Allchin, on the famous Harley-Davidson.

MIDDLETON'S Spring Wheel Sidecar was used by the winners in the 200-mile race. Messrs. Davidson (Indian) and Le Vack (Zenith).

MIDDLETONS Supply on extended payments if so desired.

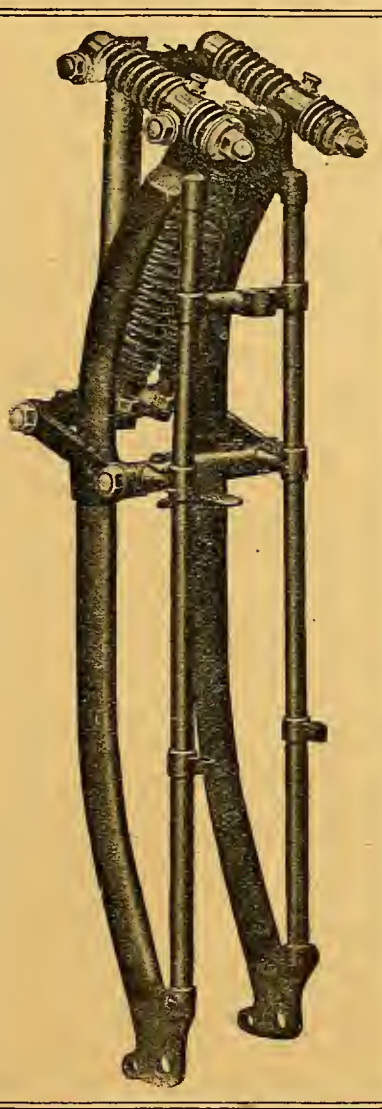
MIDDLETONS cater for New Poor and New Rich alike. Our sympathies are, however, with the former. We know how it feels, never having been anything else, for, as you are probably aware, we make a thing out of sidecars, just doing it, like the artists' model, for a bare living.

MIDDLETONS, London's Oldest-established Sidecar Makers. Business hours, 9 to 6; Saturdays, close 12. Sundays, like the Scotsmen, we stop in for economy. Saves wearing out boots, you don't need a fire, and it keeps the appetite down.—27, Cloud Green Rd., Finsbury Park. 'Phone: Hornsey 1014. [0522

The

BRAMPTON

BI-FLEX SPRING FORK.



"Comfort Trebled"

A Motor Cyclist resident in Oxford recently wrote us as follows:

"The Spring Forks I ordered from you arrived safely and in good order on Tuesday. Yesterday and to-day I have been testing them on some of the roughest roads round here, and they are a fairly good test. Naturally, my expectations were high, but I am glad to say they were exceeded by the efficiency of your Forks. The comfort of the machine has been trebled, and it steers itself almost without assistance."

The above unsolicited testimony from an actual user explains the popularity of the Brampton Bi-Flex Spring Fork. Descriptive booklet illustrating models for Motor Cycles of 2¼ h.p. and upwards on request.

BRAMPTON BROS., Ltd.

Oliver Street, BIRMINGHAM.

SIDECAR ATTACHMENTS.

NEW Watsonian Lightweight Sidecar, apron, side lamp; cost £19/5, sacrifice, £12/10; off 2¾h.p. A.J.S.—391, King St., Hammersmith. [9057

Sittingbourne, Kent.
August 17, 1922.

Mr. Brodrick,
The South-Western Appliance Co.

Dear Sir,

The St. Helier Building arrived on Saturday, two days before promise of delivery, and we are more than satisfied with it.

We erected it on Wednesday and it went together like clockwork. I am very pleased we left the order with you, as all who have seen it think the value is remarkable and admire the artistic appearance. Trusting and believing it will get you further orders from this district.

Yours faithfully,
THOS. E. KENNETT.

IGNITION, LIGHTING, ETC.

MAGDYNAMO Engineering Co., Ltd., for magnetos, spares, and repairs.

MOTOR Cyclists fit reliable high quality magnetos now and avoid certain failure of inferior magnetos.

BOSCH Enclosed Waterproof Type D.A.L. Magnetos, Government surplus, ready to fit on Indian, Harley, J.A.P., or any big single or twin, gives powerful spark at all engine speeds, makes your engine a real live engine, give you easy starting, smooth and rapid acceleration, high speed, and low fuel and oil consumption with increased power; price only £5 each, postage 1/6 extra; a 12 months' written guarantee sent out with each magneto. We give you satisfaction or refund cash.

PLEASE Note, the above type magnetos were originally manufactured for 200h.p. aircraft engines; therefore we have every confidence in claiming them to be the magneto you require for your big machine. Fit one to-day, and see life with a live machine.

HARLEY-DAVIDSON Owner writes: "Magneto to hand; many thanks for prompt despatch, satisfactory in every way; will recommend to my friends."

ZENITH Owner writes: "Since fitting magneto have completed a run of 250 miles; highly satisfied; will certainly recommend these magnetos."

INDIAN Machine Owners.—Your high-class machine deserves a high-class magneto. We want 1,000 Dixie 42° magnetos; send your magneto and £4 now, and we will immediately despatch you a Bosch D.A.L.

READY to fit on your machine; there are no alterations to make.

WHY is it that the leading Motor Cyclists—the men who know—are almost all sending to us for their Magnetos?

THERE must be a reason; there is; it is because the Magnetos of quality and guaranteed service, supplied by Magdynamo, beat all other Magnetos.

MAGDYNAMO will take your old Magneto in part payment.

REMEMBER your magneto is sent on 14 days' approval against cash per return on receipt of your order; there is no obligation to keep it until you have used it for 14 days on your machine and are satisfied; let us send you one now.

ARE You a Discerning Douglas Owner? Do you want a reliable magneto with 12 months' guaranteed service that will give you starting without worry, a smoother running, and more powerful engine and better results from your Douglas? Then send for a latest enclosed waterproof type Bosch XA2 magneto now, price only £5, carriage 1/6.

C.A.V. Magnetos (not converted starters), ready to fit on Triumphs, B.S.A.'s, Nortons, and P. and M.'s, with 12 months' guaranteed service, price £3/10, carriage 1/6.

THOMSON-BENNETT Magnetos latest enclosed waterproof type (not converted starters), ready to fit on 550 Clynos and 1808 Douglas machines, with 12 months' guaranteed service, price £3/10, carriage 1/6.

MOTOR Cycle and Car Owners, are you testing all your sparking plugs properly? Are you wasting pounds yearly by throwing away good plugs? Fit a Bosch aeroplane hand starter magneto on your garage bench to-day and always have your sparking plug tester at hand, price £2, carriage 1/6.

TRADE discounts and export quotations.—Write, call, or 'phone for terms.

A YEAR'S guarantee on repairs. Before you scrap that magneto, whatever its condition, let us see it; we will rebuild your magneto to look and work like new, no matter what make, within 3 days or 24 hours if urgent, and return it with a written 12 months' guarantee. While your magneto is being repaired we can lend you another free of charge. We could not make these offers if we were not certain of the quality of our work.

YOUR old magneto will be equivalent to new at a low cost. Send us your defective magneto now.

EXPRESS Dixie Repair Service. Your Dixie magneto, no matter what size, rebuilt equal to new and returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

ARMATURE rewinding, no matter what make, type, or size, 11/6. Wound cores from stock.

TYRES.

3/-.—Palmer and Capon Heaton, 26×2¼, new endless tubes.—Below.

25/-.—Dunlop extra heavy, 26×2¾, brand new tyres. Goods sent on 3 days' approval against cash; reduction on quantities.—Pride and Clarke, 156, Stockwell Rd., Brixton, S.W.9. [8876

26×2¼ Dunlop Heavy, new, 19/ each; 26×2⅜, £1/2 each.—35, Citizen Rd., Holloway, London, N.7. [6857

25 Per Cent. Reduction.—26in. tyres now cost only 15/- to retread. 3-ribbed or cross-grooved, 3,000 miles wear.

BURST tyres and broken away beads remoulded like new, best work in the country; send for list.—Melton Rubber Works, Melton Mowbray. [0347

MOTORISTS.—Try our 3,000 mile retreads, repairs, etc., carriage paid.—Buxton Vulcanising Co., Buxton, Derbyshire. [5836

BULL'S have your size in bargain covers and tubes. A call on us will convince you, or 'phone, Gerrard 1347.—See Below.

26×2¼.—Palmer cord, 32/6; Beldam all-rubber, 25/-; Wood-Milne 3-ply, 22/6; Clincher de Luxe, 17/6; extra heavy, 30/-; tubes, 5/6.—Below.

26×2½.—Avon Stonehenge, 27/6; Tricar, 30/-; Clincher rubber non-skid sidecar, 27/6; Goodyear cord 5-ribbed, 40/-; tubes, 5/9.—Below.

26×2½×2¼.—Palmer cord, 36/-; Beldam 3-ply, 30/-; 4-ply, 35/-; Wood-Milne 4-ply, 25/-; Clincher Dreadnought, 35/-; tubes, 6/3.—Below.

26×2⅜.—Palmer cord, 34/3; Wood-Milne key-grip 3-ply, 22/6; 4-ply, 27/6; Beldam all-rubber 3-ply, 25/-; 4-ply, 30/-; tubes, 6/-.—Below.

26×3.—Wood-Milne key-grip 4-ply, 35/-; Beldam all-rubber 3-ply, 32/6; 4-ply, 35/-; tubes, 7/6.—Below.

28×3.—Clincher rubber-studded sidecar, 30/-; Clincher de Luxe extra heavy, 45/-; Beldam 3-ply, 30/-; Wood-Milne key-grip 4-ply, 37/6; tubes, 8/-.—Below.

650×65.—Palmer cord heavy, 42/6; Wood-Milne 4-ply, 37/6; 3-ply, 30/-; Goodyear cord 5-ribbed, 42/6; tubes, 8/-.—Below.

BULL'S Rubber Co., Ltd., 3, Upper St. Martin's Lane, London, W.C.2 (next door to Aldridge's). 'Phone: Gerrard 1347. [0869

REAL Good reliable second-hand motor cycle tyres, all sizes and makes; 10/- each, plus 1s. carriage. See displayed advertisement.—H. Emanuel and Co. [0832

ECONOMIC Tyre Co.—The following new blemished and clearance covers and tubes sent on seven days' approval against remittance, per passenger train, carriage paid.

ECONOMIC.—24×2 Clipper Ideal, 14/6; tubes, 4/6; 24×2¼ (also fit 2in. rims) Dunlop heavy, 26/-; Clincher Junior, 16/9.

ECONOMIC.—26×2¼ Dunlop heavy, 26/9; Firestone extra heavy, 22/6; tubes, 4/9; 26×2⅜ Dunlop heavy, 30/-; extra heavy, 35/9.

ECONOMIC.—26×2½×2¼ Goodyear Diamond, 30/-; Avon extra heavy, rubber stud, 25/-; Palmer tubes, 5/6.

ECONOMIC.—26×2½ old standard Clipper extra heavy, 27/6; Redfern, rubber stud, 25/-; tubes, 5/-.

ECONOMIC.—28×3 Goodyear Diamond, 42/6; Goodrich Safety, 39/6; Firestone non-skid, 39/6; tubes, 6/6.

ECONOMIC.—650×65 Goodrich Safety, 34/6; Stepney road grip, 34/6; Clipper extra heavy, 27/6; tubes, 5/9.

ECONOMIC.—700×80 Goodrich Safety, 39/6; Beldam extra heavy, 44/3; Goodyear, 44/3; Goodyear cord, 58/-.

ECONOMIC.—Dunlop rubber stud, fully warranted, 24×2, 16/3; 24×2¼, 17/9; 26×2, 17/9; 26×2¼, 18/6.

ECONOMIC Tyre Co., 314, New Cross Rd., S.E.14. 'Phone: New Cross 1393. [7428

500 NEW Beldam Covers, 26×3, 2½, 2⅜, 2¼ and 2, 15/- each to clear, postage 1/6 extra.—Homerton Rubber Works, 11, Upper St. Martin's Lane, W.C.2; and Brooksby's Walk, Homerton, E.9. [0331

MASONS.—Tyres are down, and the following offers beat all:—Wood-Milne Key-grip, 4-ply covers, 26×2¼, 24/6; 26×2⅜, 26/-; 26×2¼, 23/6; 26×2½×2¼, 25/-; 650×65, 26/-; 3-ply covers, 24×2¼, 18/-; 700×80, 28/6; 28×3 (American), 27/6; 28×2½ (American), 24/6.—Below.

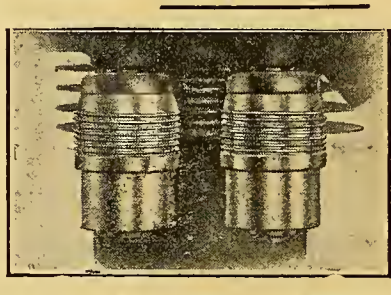
MASONS.—26×2½ Dunlop Heavy Fluted, 21/6; 26×2¼ ditto, 18/6; 26×2¼ Dunlop extra heavy ribbed, 31/-; 650×65 ditto, 30/-; perfect stock, maker's guarantee.—Below.

MASONS.—Great Offer Moseley Heavy, large studded, perfect stock:—24×2¼, 19/9; 26×2¼, 22/6; 26×2⅜, 23/6; 26×2½×2¼, 25/-; 26×2½, 26/-. Approval against remittance, carriage paid.—Masons, The Tyre House, Ipswich. [0916

F.E.W. VALVE ATTACHMENTS

SPECIAL PRICE OFFER

20% OFF IF ATTACHMENTS ARE PURCHASED FROM US before NOV. 24th.



TOTALLY ENCLOSED—GRITPROOF—LUBRICATED—AIRTIGHT—AND SILENT WORKING VALVES ARE GIVEN BY THIS PERFECT DEVICE STEAM ENGINE FLEXIBILITY—GREAT ECONOMY — HANDSOME APPEARANCE—HIGH EFFICIENCY—EXTREME SIMPLICITY.

Please write us for further particulars.

F.E.W. PATENTS CO., 217, GORDON ROAD LONDON, S.E.15.

To Rider, Agent, and Manufacturer.

The "Presto" Multi-Gear Box

for two or four strokes of 2-4 h.p., with Variable Pulley Gear, Free Engine & Kickstarter. Absolutely ideal for single geared machines. No complications, no belt slips, no cogs, no grind. Can be fitted by an amateur in two hours.

Not ONE, TWO, or THREE but MANY SPEEDS. Adjustable belt and chain line. Can easily be fitted where other gear boxes cannot.

As an Advertisement a few more only, complete with all fittings, chain and chainwheel, etc.,

£7 : 7 : 0 CASH WITH ORDER.

Carriage 5/- Extra

Automatic Road Signals.

ON another page in this issue is described a system whereby a vehicle approaching cross-roads, by passing over contact strips, will uncover a red danger signal on the other road.

While the scheme is ingenious there appear to be certain objections which make the suggestion of doubtful practicability. In the first instance, there would be no compulsion (without further legislation, from which save us!) to make drivers go on to the contact strips; omission to do so therefore would not be a legal offence, so that the signal could not be relied upon to determine the onus of responsibility in the event of an accident.

Should a vehicle be following another at close quarters, the leader might easily re-set the signal to "clear" after the second had crossed the first or setting strip, so allowing the latter to run out into an unwarned traffic stream.

Vehicles travelling in the opposite direction also might get on to the strip and so leave the signal at "danger" (thus slowing up traffic) until the next one came up on the other side.

On the railways, where drivers charge into the blackness of night at 70 m.p.h., depending on the signals operated by responsible officials, automatic signalling has only met with limited success. When a signal fails, the engine driver's very dependence on its message results in the calamitous accidents which from time to time occur.

Since road traffic is not of necessity controlled by so precise and scheduled an organisation as railway working, the possibilities of automatic signalling with safety and success appear to be remote. Wider roads, unobstructed corners, and the driver's vigilance and dependence on himself are the surest specifics for safety.

The Solo Motor Cycle.

AT this time of the year there are always many young men eagerly awaiting the opening of the Olympia Motor Cycle Exhibition to choose finally their first machines. This year, however, the number is augmented by a new class composed of people who hitherto have not been seriously interested in the motor cycle proper, but require a bicycle with an engine to propel it.

In addition, there are perhaps two hundred thousand existing motor cyclists whose interest lies chiefly in the solo machine and whose requirements are fully as varied as their bank balances.

With solo motor cycles ranging in size from 42 c.c. to over 1,300 c.c., the man who prefers the single-track machine cannot complain that he has been neglected! That so many types are produced is proof of the popularity of the motor cycle and of the industry's confidence in future demand.

Compared with any other form of travel, the most extravagant of solo motor cycles is so remarkably economical that there should never be any diminution in the annual demand for these machines. Further, thousands of school boys only await the day when they will attain the age demanded by the law before they join the ranks of motor cyclists. Understanding parents appreciate the real value of the modern motor cycle from both an educative and health-giving point of view.

While the sidecar outfit may ultimately be threatened by the light car, and the small car itself by the large, cheap American car, there is nothing as yet to replace the solo motor cycle. Not only is this so, but the pleasurable sensation of travelling on a self-propelled two-wheeler is quite unique in the world of wheels or wings.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

BY IXION

North and South.

THE leaderettes in technical papers are usually statesmanlike. That is to say, they are apt to prove dull to bobby-defying barloafers like myself. But I make an exception on behalf of our issue of October 26th (No, I didn't write them—never saw 'em till in type). That one on the relative merits of northern and southern riders got me where the hair is short; am I not a Lancashire lad, exiled in a southron county? On this subject I will be perfectly frank. I believe in the old maxim "South for manners and North for (I am quoting) 'guts'!" If a club secretary in, say, Bradford, tries to beat up his men for a big club muster, he will hear some very straight talk. He will be told bluntly what a washout the last muster was, how rottenly he managed it, and what unpleasant company half the members are. But every man who promises to attend will be there, even if it snows Gillette blades. (The northerner calls himself "straightforrard," by which he really means "abominably rude"; but he is a man of his word, and isn't frightened of a cageful of leopards.) The secretary of a southern club, similarly engaged, will never hear what his members thought of his last stunt. Honied speaking and smooth promises will greet him at every call. But if an attractive fixture is blest with gorgeous weather some of the men who said they were coming will not be there; and if it snows . . . ! ! !

Into the Hornets' Nest.

I KNOW I am buying trouble, but natheless I proceed. The courtly editor who wrote our leaderette of October 26th obviously *knew* that there is no real comparison between the southrons and the northerners, but, editor like, saved himself by heading the paragraph "Sportsmen All" (true enough, that!), and throwing a few incidental bouquets in the direction of Wales, the Midlands, and the South-West. I have lived in all these localities. I believe that if our southern riders had the misfortune to reside in the manufacturing districts of Lancashire or Yorkshire they would never motor at all until they could afford a 40 h.p., six-cylinder car. Why, even with the benefits of their southern residence most of them take jolly good care to get home before it is dark, and lay up their machines for most of the winter. Up north I know innumerable grey beavers who flounder over pot-holed setts and petrified kidneys for most of their summer mileage, and maintain the good work merrily right through their bitter winter. And when week-ends arrive, instead of sitting at home or in a bar by a glowing fire and applying vaseline to the callosities on their anatomies, they go off and look for half-frozen water splashes or the kind of hill that resembles a well-treacled ladder. My advice to posterity is as follows: Be born right up north of good north-country stock. Stay there till you've imbibed a "reet" northern spirit; and then come south and enjoy the rest of your natural life.

"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

A Solo Screen.

MR. EASTING'S original solo screen appeared, I think, in the Isle of Man in the dimensions of a geisha's fan. His latest edition just to hand is a far more lordly fitting. The celluloid panel measures about 21in. high × 16in wide, is well framed, and carried in two brackets easily fixed to the steering bar if any gaps are available between the existing decorations of that misnamed and overloaded article. The new screen weighs no more than 4 lb. complete, and really gives very welcome protection. Quite a useful waterproof apron, weighing 1½ lb., may be fixed to the lower rung of the screen, so as to protect the rider's knees and tummy. With these Easting fitments and a pair of John Bull muffs, motor cycling in Arctic weather is really almost cosy.

Will History Repeat Itself?

JUST at the moment the 150 c.c. 100 lb. machine stands pretty much where the first Douglas stood at its original introduction. Its makers believe in it; but most sellers are unconvinced, and the public are inclined to be sceptical. I have only one real

Occasional Comments.—

"if", to urge against the 150 c.c. The 350 c.c. never made good till it got hold of a sound transmission, *i.e.*, something which would stand rain and take hills.

I remember being given a trade loan of a Douglas umpteen years ago, and refusing to write it up because its single-geared belt drive reduced me to an average speed of 10 m.p.h. *plus* 48s. spent on new belts between London and Edinburgh late one autumn. Its engine was right long before its transmission was right. So I wait to be convinced that the new 100 lb. machines are endowed with transmissions that will satisfy the public. Belt drive off a small pulley can be a really heartbreaking job on a cold wet day.

But . . . . .

I REMEMBER spending a joyous and trouble-free season at the request of the Triumph Co. on an experimental machine of theirs which was simply fitted with an ordinary push-bike two-speed hub. I do not remember whether, in those days, the engine was rated at 3 h.p. or 3½ h.p.—probably the former; but the hub was a standard pedal hub, and it never let me down. The firm dropped the idea because some of their testers managed to shear the hubs by lurid gear changes. But I see no reason why the 100 lb. featherweight should not be quite content with a two-speed hub of push-bike type—what matter if strengthening it up added 2 lb. or so? With such a hub, beset by no fiercer stresses than those of a low-geared fast-running 150 c.c. flat twin, on which each power stroke is more like a jilted maiden's sigh than anything else, a primary chain, and a final belt, the featherweight would enjoy an efficient, dreadnought drive. Give it that, and I am prepared to gamble on its success.

The Triumphant 350 c.c.

SOME of us can still recall the amusement with which the "boys" greeted the first trio of Douglas lightweights to appear at the start of an A.C.U. Six Days. None of them completed the course, for their hastily improvised frames cracked up; but the engines had done more than enough for glory before the frames collapsed; and some of us murmured: "Why, with a two-speed gear that engine would . . !" And so it has. It is by this time a patriarch with an innumerable progeny. It is sober sense to say that no soloist *needs* anything bigger than a 350 c.c. If he chooses to lug about with him 1,000 c.c. mounted in a specification weighing upwards of 3 cwt., that is his funeral. But 350 c.c. will give him as much climb as anything else, as much speed as a rational man can utilise on British roads, as much comfort as any rival type, and the top notch standard of reliability. So the last two years have seen 350 c.c. admitted to the ranks of the full touring solo machines; and I suppose that ere long the plucky little engines will be accepted as useful sidecar pullers—many are so used already.

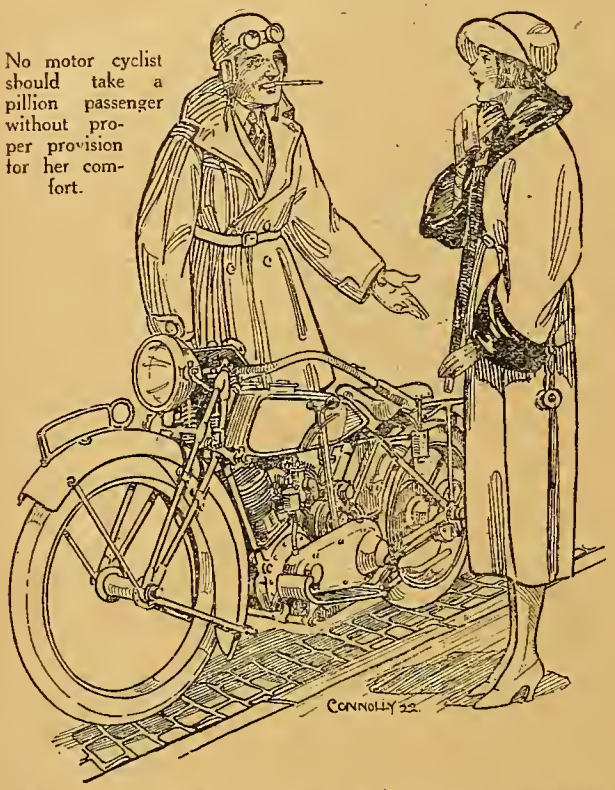
A I

WHERE THE CIDER APPLES GROW.

In the county of narrow and picturesque lanes. A scene near Tiverton, Devonshire. Tortuous by-ways, richly cultivated land, mellow sunshine glowing on homely thatched cottages—will such summer memories come to the minds of the London–Exeter competitors in the cold grey dawn of December 27th?

PILLION RIDING.

Points to Observe for the Safety of Rider and Passenger.



No motor cyclist should take a pillion passenger without proper provision for her comfort.

AT some period or other of his motor cycle career almost every rider finds occasion to carry a passenger on the carrier of his machine.

Unfortunately, it cannot be denied that a certain proportion of the accidents to motor cyclists which have occurred during the present year have involved two persons—the rider and the pillion passenger. Very seldom, however, has it actually been proved that the mere fact of the carrier being occupied by a second person has been the cause of the mishap.

Pillion Riding Not Necessarily Dangerous.

Properly practised, pillion riding is not necessarily dangerous. By itself, the mere fact of there being a passenger behind the driver is not sufficient to warrant the condemnation of the practice. Many a motor cyclist will testify to having regularly carried a pillion passenger without the slightest mishap, and will aver that the extra weight over the back wheel in no way detracts from his control of the machine.

Usually, however, one will hear it emphasised that there is a right and a wrong way of carrying a passenger, and, of the two, it is generally agreed that the side-saddle attitude does not give the driver such a comforting sense of security as the astride position. The reason is obvious: the side-saddle position does not afford the passenger any support for the upper part of the body, and in a sudden swerve, or when rounding a corner, the passenger may lurch, and considerably embarrass the driver.

Side-saddle Preferred, but—

It is only natural that the majority of lady passengers should prefer the side-saddle attitude. The motor cyclist will, however, be well advised to attempt methods of peaceful persuasion in an endeavour to bring about the adoption of the astride position when a really long run is under consideration.

If a passenger is to be carried with any frequency, a proper pillion seat attachment for the carrier is a *sine quâ non*. Such a fitment should incorporate a handrail and footrests if the prospective passenger firmly refuses to sit astride. A loose cushion on the carrier should be eschewed, save, perhaps, as a purely temporary expedient, for it may shift its position with, possibly, disastrous results. It is as well, also, to warn the passenger that, if the back number plate be obscured, he or she may be held liable for "aiding and abetting" within the meaning of the law should some constable chance to observe the "crime."

The privilege of being able to carry a passenger on a solo machine is valuable, and one hopes that motor cyclists generally, by observing a little common sense in the matter of seating the passenger securely, and by not deliberately taking risks in attempting to negotiate impossible surfaces, will counter the prejudice against pillion riding which exists in the public mind to-day. One might, perhaps, label the following points as the golden rules:—

1. Seat the passenger astride.
2. Fit a proper pillion attachment, with footrests, securely to the carrier.
3. Keep off tramlines and take no risks in traffic.

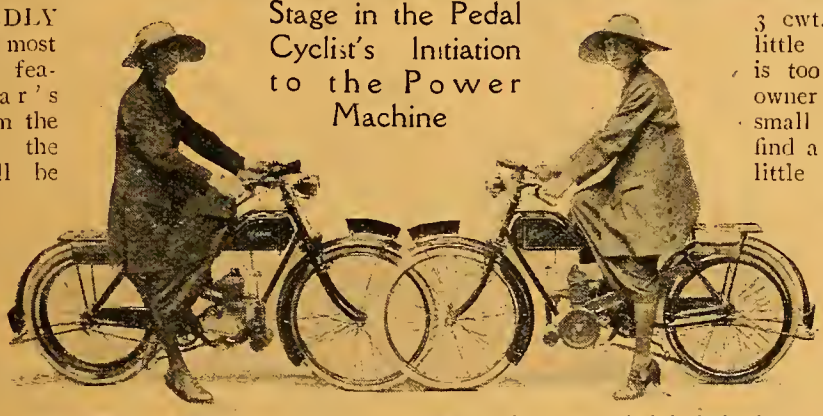
Although very popular, the side-saddle attitude does not give the driver such a sense of security as the astride position.

The Stepping-stone to Serious Motoring

Motorised and Motor-assisted Bicycles and Miniature Runabouts as a First Stage in the Pedal Cyclist's Initiation to the Power Machine

UNDOUBTEDLY one of the most interesting features of this year's Olympia Show, from the point of view of the general public, will be the number of ultra lightweights on exhibition.

The motor cyclist who goes to Kensington to decide finally whether his 1923 mount is to be a Brough Superior, an overhead valve Triumph, or a Sunbeam, will, of course, look upon these miniatures as toys, and veterans who retain memories of the motorised bicycle of a decade or more ago may regard them with suspicion. But the man-in-the-street and his lady who are looking for a power-propelled machine to take the place of their pedal cycles will be interested. It is now generally realised that there need be little fear of breakdown, and that technical knowledge of internal combustion engines is not essential in order to run a motor cycle.

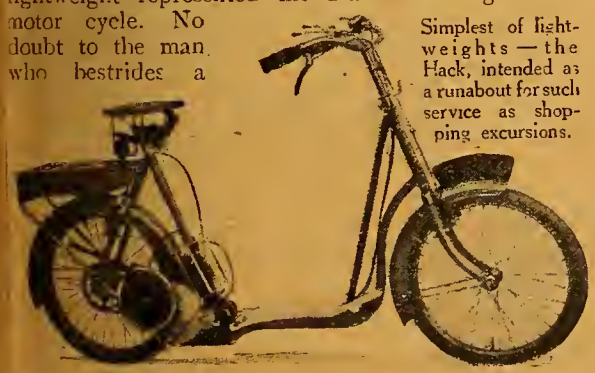


The McKenzie is made with frames to suit short or tall riders. The lady depicted, on the left, is shown seated on the smaller model and, on the right, on the larger type. Observe that in the latter case she is not able to place her foot firmly on the ground.

Motor Cyclist Friends.

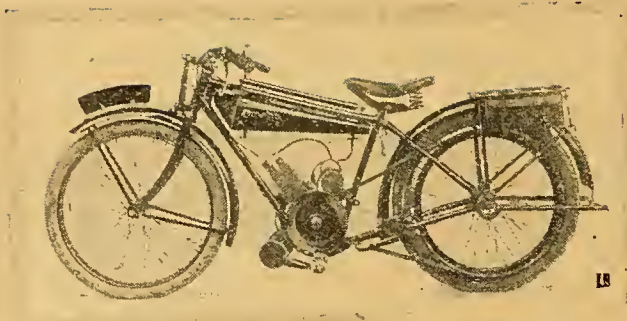
Such visitors to Olympia may have motor cyclist friends who perhaps will tell them that these new miniatures are too light, that they are under-powered, and that they have no speed. At the Show last year an enthusiast was overheard to tell an elderly relative that she wanted plenty of power, a clutch and kick-starter, and a two-speed gear. To this motor cyclist, who probably used a heavy big twin solo, a 180 lb. lightweight represented the minimum weight for a motor cycle. No doubt to the man who bestrides a 3 cwt. monster even the little Levis or Velocette is too light, just as the owner of one of these small motor cycles may find a 75 lb. McKenzie a little strange to ride. To all experienced motor cyclists the ultra lightweights of the type represented by such machines as the McKenzie and J.E.S. will appear ridiculously light, yet the pedal cyclist on joining the ranks of motorists by means of a motorised bicycle or an ultra lightweight may, at first, find the new 75 lb. machine somewhat heavy.

This question of viewpoint as regards weight is a very important one, for while the first essential of a machine for the masses is low weight, there are critics who say that lightness means discomfort *because they*



Simplest of lightweights — the Hack, intended as a runabout for such service as shopping excursions.

This J.E.S. of 169 c.c. capacity survived the A.C.U. Six Days Trials and demonstrated the capabilities of the small engine when used in conjunction with a four-speed gear.

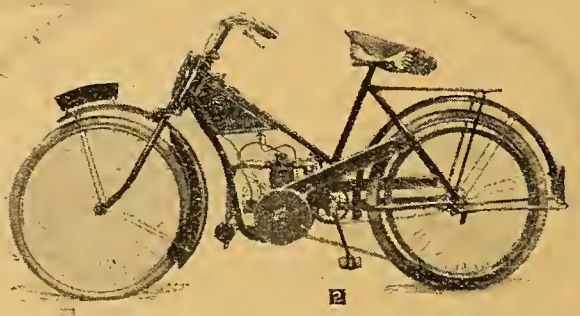


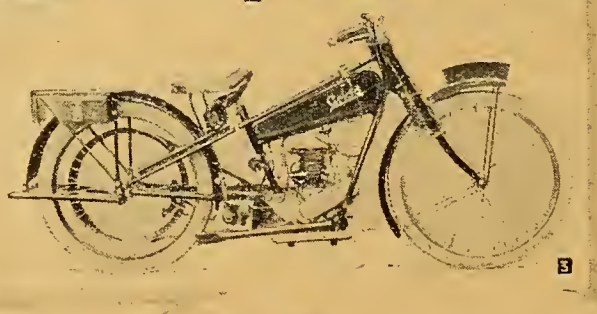
judge the requirements of the newcomer from their own.

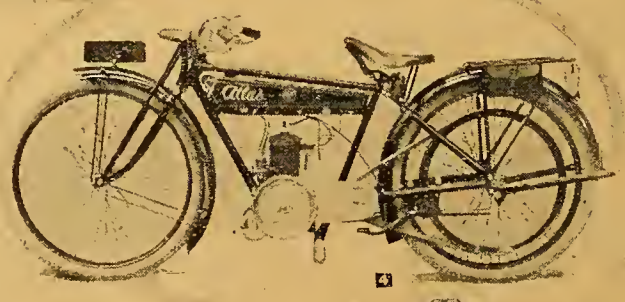
It is all a matter of relativity. The owner of a Rolls-Royce car would probably prefer to walk rather than drive a small car. He would say that the latter is too light and shakes him up too much, yet the owner of the light car thinks he is riding on the wheels of luxury.

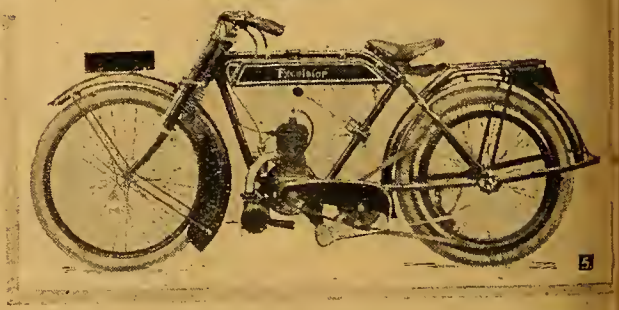
The new ultra lightweights are not intended to give the same service as a motor cycle of the orthodox type. They are intended to provide a little more comfort and a little more speed than the pedal cycle, without the effort of pedalling.

So long as an owner realises this he or she will obtain the greatest satisfaction and service from an ultra lightweight, which has a definite place in the world of wheels just as has the motor dinghy in the world of boats. Unfortunately, perhaps, the majority of these motorised bicycles—if such they can be called—are capable of really high speeds. Mr. McKenzie has a document in the form of a summons which officially states that a McKenzie on a certain occasion exceeded 34 miles per hour.









Engines Too Large, Not Too Small.

Small as these little engines are, it is the writer's opinion that they should be still smaller, so that they are incapable of exceeding the speeds for which the machines have been designed. With an engine of, say, 100 c.c. and a diminutive three- or four-speed gear, an ultra lightweight should be capable of going almost anywhere and yet have a low maximum speed. What a 169 c.c. engine and four-speed gear in a light machine will do is exemplified in the performance of the J.E.S. in the A.C.U. Six Days Trials. This little machine deserves to secure its maker a fortune if only for the fact that for many years he has marketed and developed the one type. Every year a number has been sold, but this year, by the aid of a four-speed gear, it has made quite a reputation in really severe trials, including the Six Days event.

But the average man-in-the-streeet does not require a machine to scale mountain tracks. A few may live on the top of the Cotswolds and may require to make frequent calls in the valleys. For them there is the J.E.S. and other machines of like capacity and equipped with gear boxes. The majority of those who need a motor-propelled bicycle require it for main road use, and a smaller engine with a three-speed gear would give the same service as the *single-geared* machines of 160 c.c. now offered to the public.

It is in order to provide ample reserve of power to climb hills on a single gear that engines are even as large as they are—and speeds around 30 m.p.h. are thus rendered possible.

From the foregoing it will be seen that the purchaser of an ultra lightweight such as will be exhibited at Olympia need have no fear that the machine will not live up to its designers claims. If such machines err it is in being capable of much more than the ex-pedal cyclist requires, who having mo

ıe Stepping-Stone to Serious Motoring.—

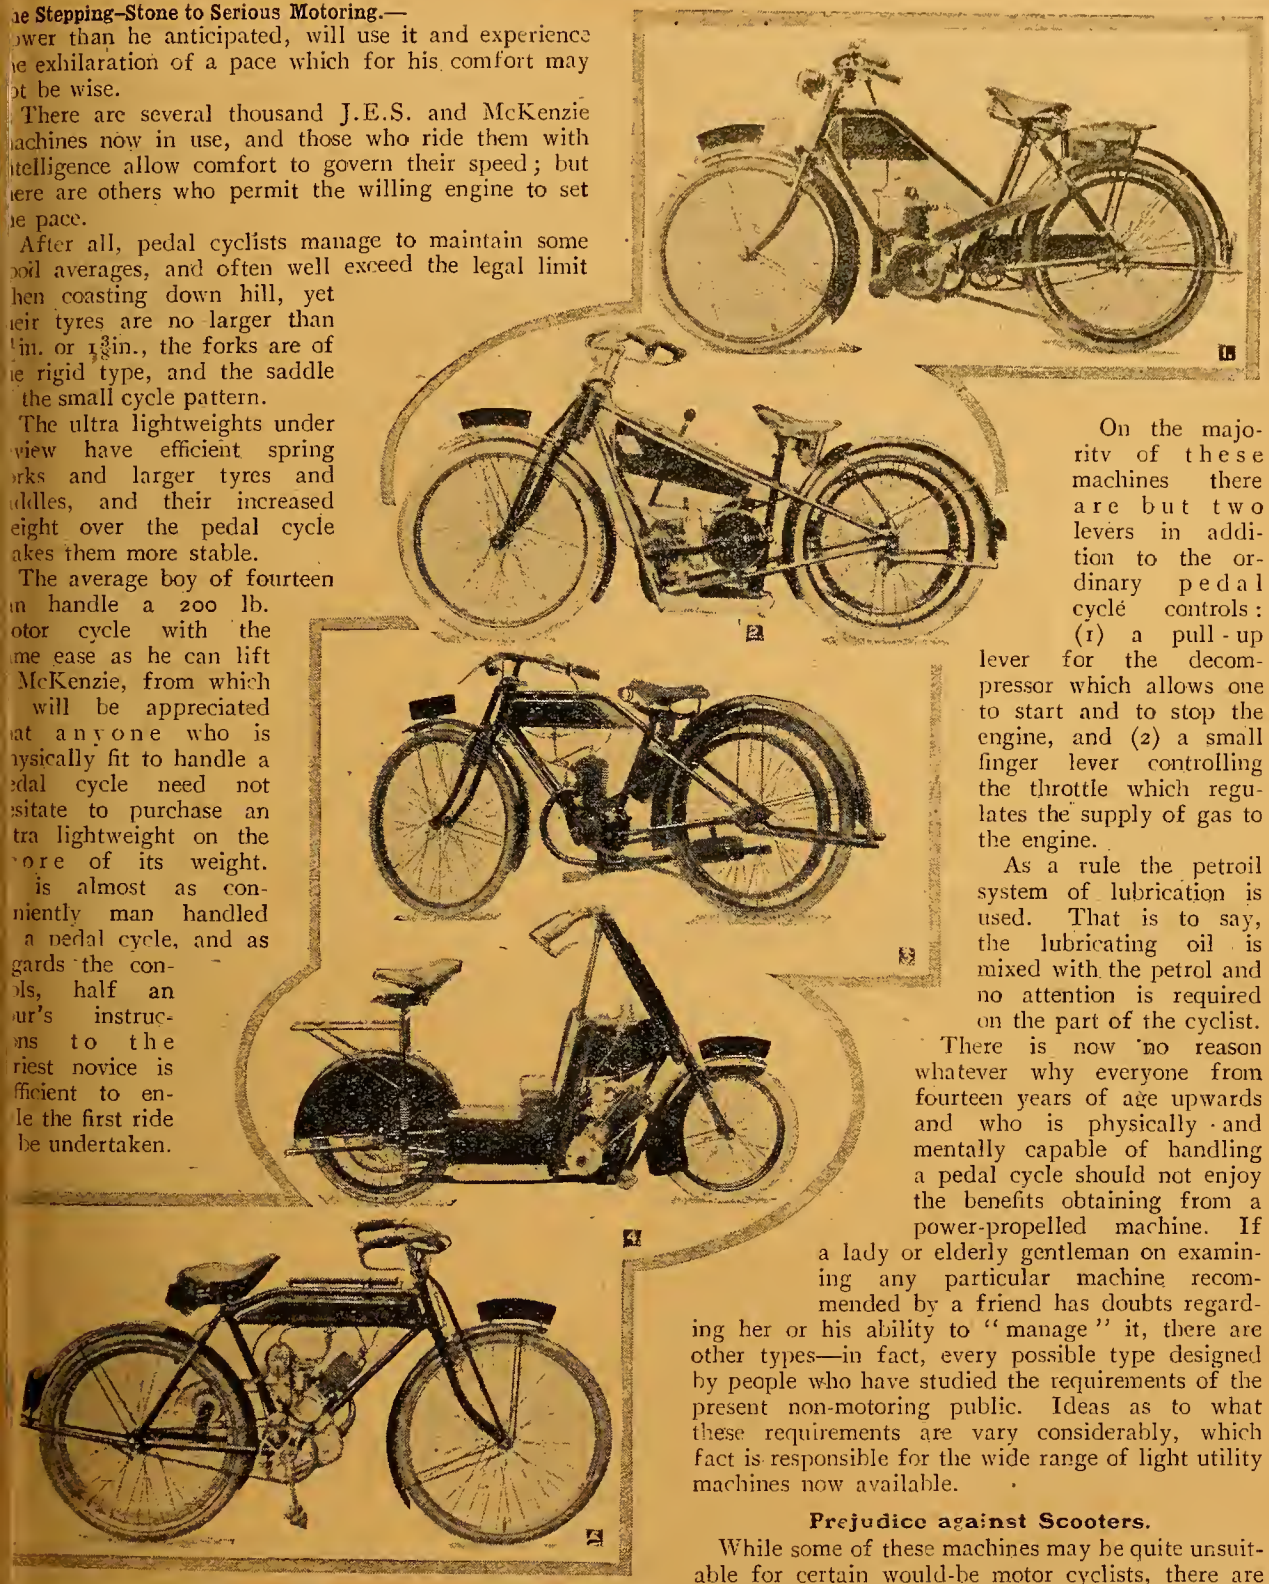
)wer than he anticipated, will use it and experience ıe exhilaration of a pace which for his comfort may)t be wise.

There are several thousand J.E.S. and McKenzie ıachines now in use, and those who ride them with ıtelligence allow comfort to govern their speed; but ıere are others who permit the willing engine to set ıe pace.

After all, pedal cyclists manage to maintain some)ol averages, and often well exceed the legal limit hen coasting down hill, yet ıeir tyres are no larger than in. or 1¾in., the forks are of ıe rigid type, and the saddle the small cycle pattern.

The ultra lightweights under view have efficient spring)rks and larger tyres and ıddles, and their increased eight over the pedal cycle akes them more stable.

The average boy of fourteen ın handle a 200 lb. otor cycle with the me ease as he can lift McKenzie, from which will be appreciated at anyone who is ıysically fit to handle a edal cycle need not sitate to purchase an tra lightweight on the ore of its weight. is almost as con- niently man handled a pedal cycle, and as gards the con- ols, half an ur's instruc- ns to the riest novice is fficient to en- le the first ride be undertaken.



MODERN MOTORISED BICYCLES AND ULTRA LIGHTWEIGHTS

1. 169 c.c. McKenzie.
2. 165 c.c. Economic.
3. 150 c.c. Sun.
4. 142 c.c. Kenilworth.
5. 116 c.c. J.D.

On the majority of these machines there are but two levers in addition to the ordinary pedal cycle controls: (1) a pull-up lever for the decompressor which allows one to start and to stop the engine, and (2) a small finger lever controlling the throttle which regulates the supply of gas to the engine.

As a rule the petroil system of lubrication is used. That is to say, the lubricating oil is mixed with the petrol and no attention is required on the part of the cyclist.

There is now no reason whatever why everyone from fourteen years of age upwards and who is physically and mentally capable of handling a pedal cycle should not enjoy the benefits obtaining from a power-propelled machine. If a lady or elderly gentleman on examining any particular machine recommended by a friend has doubts regarding her or his ability to "manage" it, there are other types—in fact, every possible type designed by people who have studied the requirements of the present non-motoring public. Ideas as to what these requirements are vary considerably, which fact is responsible for the wide range of light utility machines now available.

Prejudice against Scooters.

While some of these machines may be quite unsuitable for certain would-be motor cyclists, there are others which would in every way fulfil their needs.

It is perhaps surprising that the little Kenilworth has not caught the public fancy as much as it deserves to do. Probably its similarity to the

The Stepping Stone to Serious Motoring.—

"scooter" is responsible, although there is nothing of the scooter about the Kenilworth either on the point of efficiency or comfort. True, it is small, but that should be an advantage to many would-be motorists, although perhaps it is just a little too small, and tall persons may *appear* a little cramped to the passer-by. No machine could be easier to start than the Kenilworth. It starts at walking pace, and the most nervous of riders finds no difficulty in mounting it.

In the same category as the Kenilworth is the Hack —another scooter-like machine intended purely for runabout purposes.

Auxiliary or Motorised Bicycle.

The "next size larger" type is often termed the motorised bicycle because it resembles a pedal cycle with an engine to drive it. It is very easy to confuse this type of machine with the auxiliary-powered bicycle which is actually an ordinary pedal cycle with a small engine attached. Such a machine has its place perhaps, but it is not suitable for use on bad roads or *pavé*, neither is it wise to exceed the speeds at which an ordinary pedal cycle usually travels, for the reason that the average cycle is not built sufficiently strong to withstand the extra weight and the mechanical power propelling it. The motorised bicycle proper is one that has been designed throughout for power propulsion. It is, in fact, a light motor cycle with pedalling gear. At the head of this class are the McKenzie and J.E.S., both of which have spring forks and follow orthodox motor cycle practice where necessary.

There have been very few of this kind of motor cycle on the market during 1922, excepting the two makes mentioned, which may be said to have awakened the rest of the industry to possibilities of the type with the result that the numbers representing it will form one of the chief features of the forthcoming Olympia Show.

With all motor cycles which form a stepping-stone to more serious motoring, the would-be purchaser has to satisfy herself or himself on two points. First, is the preference for a machine like a bicycle or like a motor cycle? Second, whether the chosen machine is easy to mount.

It may interest the tyro to know that the weights of the respective types are approximately as follows:

Racing bicycle	25 lb.
Tourist bicycle	42 lb.
100 c.c. auxiliary motor on bicycle	65 lb.
150 c.c. motorised bicycle	75 lb.
150 c.c. ultra-lightweight motor cycle	100 lb.
211 c.c. lightweight	140 lb.
250 c.c. lightweight	160 lb.
350 c.c. junior machine	190 lb.
500 c.c. senior motor cycle	260 lb.
600 c.c. motor cycle	290 lb.
750 c.c. motor cycle	320 lb.
1,000 c.c. motor cycle	340 lb.

As is well known, the majority of motor cycles are made irrespective of the fact that they may be used by a short person or one well over six feet. Except for the slightly cramped position for a tall man on a small machine, it does not matter to an inch or so what distance it is from saddle to handle-bar, but often the short-legged rider is made to feel less confident because he cannot place both feet firmly on the ground.

Riding Position and Saddle Height.

The correct riding position on a motorised bicycle is more important for the reason that with a single geared machine it is necessary to start by means of the pedals. Mr. McKenzie has realised this important point and now wisely offers two models with different saddle heights.

In the next class there are the little Atlas, Economic and Grigg machines, all successful during the past year, and now representative of a type to which such new models as the Sun, Omega, and Excelsior are newcomers.

They usually resemble the orthodox motor cycle in their design—in fact, they are just miniatures of the types which have taken very many years to develop.

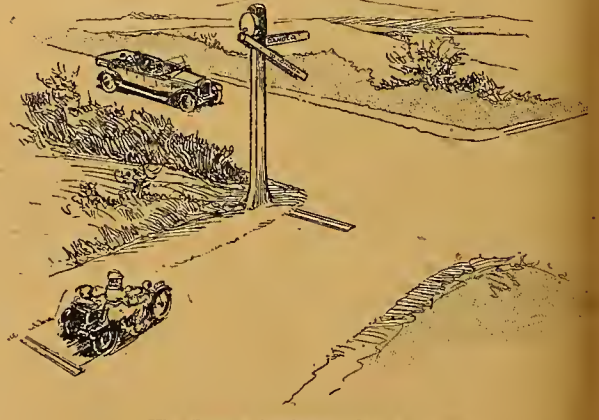
Thus, to summarise, motor cycles at Olympia will cater for every known requirement.

AUTOMATIC WARNINGS AT CROSS ROADS.

INTENDED to eliminate cross road dangers a device has been evolved for automatic signalling by approaching cars themselves. The device consists of two bars occupying one-third the width of the roadway, one placed at some distance from the corner and the other actually at the road junction. These bars are connected to a signalling arrangement composed of one fixed arm, on which is indicated the word "danger," and which is provided with a red reflector for use by night. A movable arm bears the usual signpost directions, and also serves to cover the danger arm.

When a vehicle touches the first of the two movable bars, the cover of the danger sign is dropped clear and a gong rings, thus giving warning to any machine approaching the cross road that another is coming-up. On the vehicle reaching the cross road it touches the second bar and the signal is returned to its normal position.

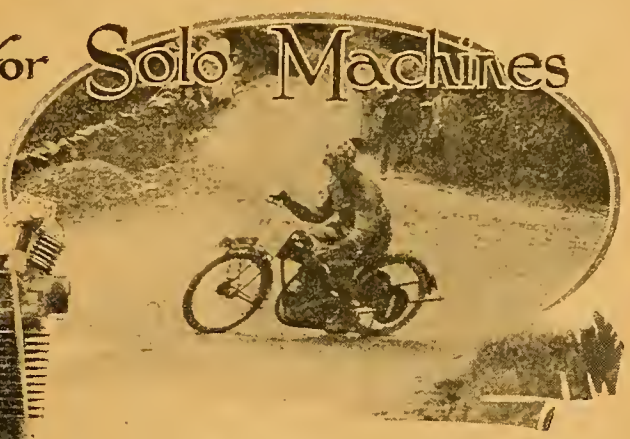
The inventors are J. W. Proctor, 24, Margarets Road, and J. Burlinson, 81, Jesmond Terrace, both of Whitley Bay, Northumberland.



The Proctor-Burlinson device in use.

Small Engines for Solo Machines

IN RELIABILITY TRIALS. The 250 c.c. solo mount has competed on an equality with bigger machines—and succeeded.



BY RACING. Development of small engines has been fostered by racing on both road and track.

TWENTY years ago motor cycles were just emerging from the experimental state, and the early power units, evolved from the stationary gas and oil engines of the period, were of comparatively small capacity.

Designed on "gas-engine" lines, they were harsh, slow-pulling affairs running on high gear ratios. They were soon found to be inadequate for the work they had to do, and "monsters" (as they were then regarded) were brought into use, and later came 500 c.c. and 600 c.c. engines, all embodying the same low-efficiency, high-geared, slow-pulling characteristics.

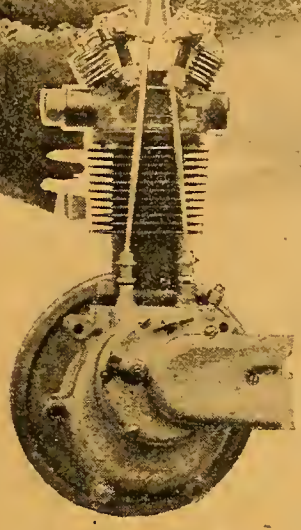
It was not seen, or, if seen, it was not thought possible to take advantage of the fact that the small engine would produce all the power needed providing it could be run at a high rate of revolutions when suitably arranged to transmit its power through a considerable gear reduction.

Slow Development.

Through the earlier history of the motor cycle movement, speed and power were sought by increasing the size of the slow-running engines until a limit was reached, then twin-cylinder engines—virtually two single-cylinder engines with a common crankshaft—were developed; but truly high-speed power units were tardy in their evolution, even after the limit of the slow-speed big engine was realised.

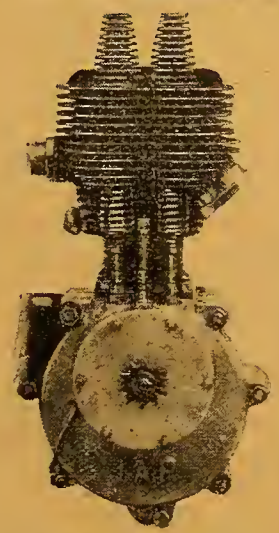
Finally, two types of power unit came under consideration, which markedly affected motor cycle design; these were the flat-twin four-stroke and the single-cylinder two-stroke.

Curiously enough, these engines represented two distinct schools of design—the first, progressive, seeking power from a small capacity by the high revolutions permitted by the almost perfect balance of the flat-twin; the second conservative, be-



Typical of highly efficient overhead valve design; the 250 c.c. Blackburne engine which, in a Sheffield Henderson machine, attained a speed of 72·89 m.p.h.

Development of the 250 c.c. Motor Cycle as a Capable Touring Model. Notable Achievements on Road and Track.



A clean and straightforward design, the 250 c.c. side-by-side valve J.A.P. unit, embodied in many successful small machines.

cause the small two-stroke, with its excellent low-speed pulling, discovered at last the secret of a successful small high-geared (which is synonymous with single-geared) engine.

The Promise of the Small Engine.

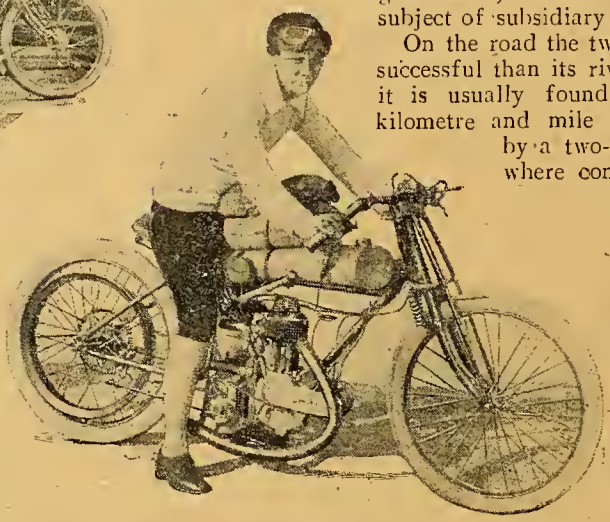
For many years *The Motor Cycle* had foreseen and predicted the ultimate success of a miniature type of machine suitable for universal use; a solo motor bicycle, which, while capable of going anywhere, would, by virtue of its small, light and even running power unit, be in itself light in weight, easy on tyres and transmission, and economical in upkeep. This belief, so frequently expressed, was given practical support by the offer of cups for the best performance of a machine of 250 c.c. capacity or less in the Junior T.T. races of 1920 and 1921, after it was felt that the 350 c.c. machines had become well-nigh equal to the once universally popular 500 c.c. solo mount.

Perhaps more than any other type of power unit the flat-twin showed what could be done with medium- and small-cylinder capacities and extremely high engine speeds in conjunction with suitable gearing. Directly, however, the flat-twin had no part in the evolution of machines under 350 c.c. capacity, but this was chiefly on account of mechanical considerations.

Having established the possibilities of small high-speed engines, manufacturers were not slow to return to the miniature unit of something under 250 c.c., and the efficiency of this size has been so highly developed in certain instances that it seems unlikely that the better examples can be much further improved in respect of power output; at the same time, it does not seem likely that anything smaller than 200 c.c. can offer all that is required in a touring machine for some time to come.

Perhaps the most successful two-stroke exponent of the day, G. S. Davidson and his 247 c.c. Levis have occupied the winning position in this year's 250 c.c. T.T. and the French and Belgian Grand Prix Races.

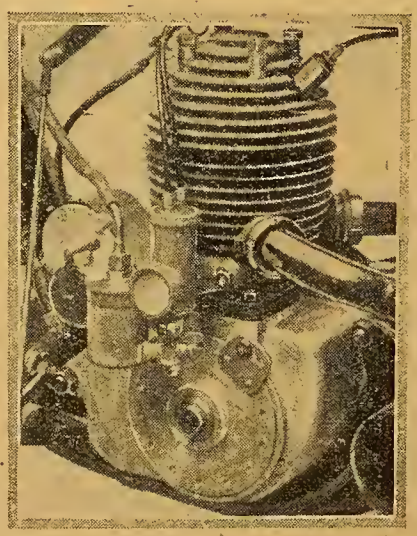
Developments in steels have made diminutive valve mechanisms very reliable, but something still needs to be done in this sphere, and more workmanlike oiling systems may be needed in order to maintain small engines at the full pitch of their power. These things alone delay the entry of the 250 c.c. solo mount into a period in which it may well have a vogue as great as that enjoyed by the 500 c.c. type a few years ago. Naturally, so small an engine requires a wide range of gearing, and the introduction of a small, compact four-speed gear box designed primarily for machines with a cylinder capacity not greater than 250 c.c. would be an immense boon to the industry; such a gear box is by no means impossible when the torque impulses to be dealt with are delivered with such rapid frequency and are themselves comparatively small. Indeed, one lightweight maker has produced his own four-speed box.



Twenty-four hours' riding at an almost unvarying speed of 45 m.p.h. is a wonderful physical feat, therefore Mrs. Janson's achievement on the 250 c.c. Trump-Jap tends to overshadow the remarkable maintenance of power which the tiny engine displayed.

Four-stroke Progress in the 250 c.c. Class.

Since 1919 the 250 c.c. four-stroke has shone conspicuously in many of the leading competitions, having provided the winning type in the 1921 T.T. race (250 c.c. class) and in the 500 Miles Race at Brooklands in the same year. Besides gaining a full proportion of premier awards in reliability trials, a machine of the 250 c.c. four-stroke type covered 1,071 miles 1,180 yards in 24 hours (44.65 m.p.h.) at Brooklands. Another covered 400 miles at a speed of 56.67 m.p.h., and two others were first and second in the recent Ulster Grand Prix.



An increasing development has characterised the evolution of the Velocette engine and the lessons learnt in racing are, one by one, applied to the touring machines. This is the 1922 T.T Velocette engine—prototype of the 1923 touring model.

Although not running on absolutely parallel lines, the development of the 250 c.c. two-stroke has been pursued concurrently and equally energetically.

While the four-stroke adherents have had to strive to attain reliability under the searching requirements of super-efficiency and abnormally high speeds, the two-stroke school, favoured by an inherent simplicity, has sought all along for increased power from the given size; reduced fuel consumption has been the subject of subsidiary research.

On the road the two-stroke type has been even more successful than its rival; for sheer speed on the track it is usually found wanting (although the present kilometre and mile standing start records are held by a two-stroke in the 250 c.c. class), but where continuous acceleration and deceleration are needed, where long gradients are encountered, and where unquestioned reliability is of prime importance, the simple, light two-stroke with its even torque delivery is pre-eminent.

The 250 c.c. class in the 1920 T.T. was won by a two-stroke, which again repeated the performance in 1922; this year also a two-stroke won the 250 c.c. classes in the French and Belgian Grand Prix. The same machine also was the only one to gain full marks in the British team in the strenuous International Six Days Trials in the Alps.

Probably the foremost exponent of the 250 c.c. four-stroke in the country, B. Kershaw has taken the premier award in many open trials in competition with all types and sizes of machines.

250 c.c. Models in Official Tests.

In the last A.C.U. Six Days Trials the proportion of retirements to starters in the 250 c.c. class was less than in any other section. Thirteen started, eight being two-strokes (one of but 169 c.c. capa-

Small Engines for Solo Machines.—

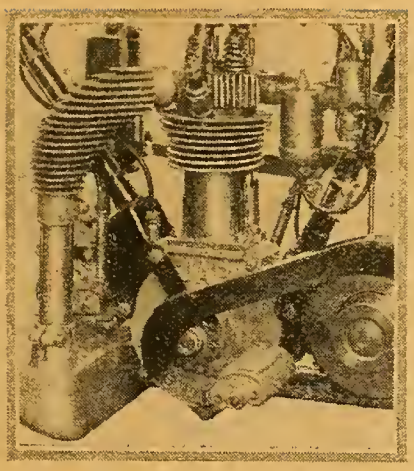
city), and five four-strokes. Of the former six gained gold medals and two qualified for certificates; of the latter four received gold medals and one retired.

After the 800 miles of strenuous road testing involved in the Six Days Trial, it is noteworthy that the first four machines were able to cover some sixty odd miles on Brooklands at over 42 m.p.h., the best two-stroke averaging 43.5 m.p.h. and the best four-stroke 43 m.p.h.

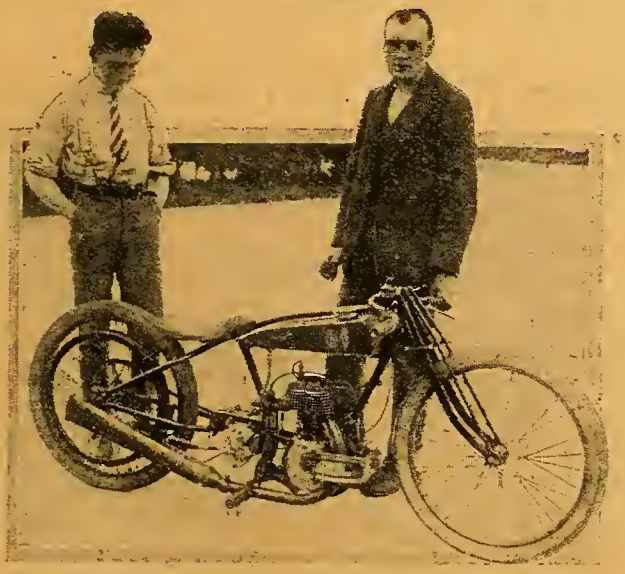
Perhaps the T.T. races show how closely the two types vie with each other. For example, the 1920 250 c.c. class was won by a two-stroke at 38.31 m.p.h., no four-strokes being entered in the small capacity category.

In 1921 a four-stroke annexed *The Motor Cycle* Cup for the 250 c.c. machines at a speed of 44.9 m.p.h., beating the previous year's speed handsomely; two-strokes occupied the next four places.

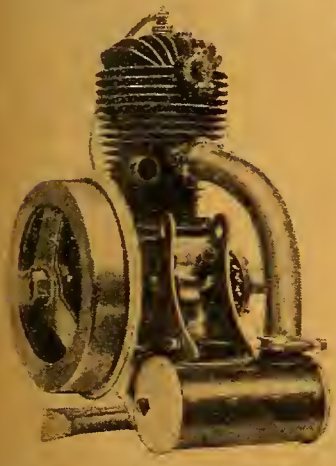
This year a separate 250 c.c. Tourist Trophy was offered, and it was gained by a two-stroke at the amazing average speed of 49.89 m.p.h. for the course of 188¾ miles; the second 250 c.c. machine (four-stroke) averaged 47.12 m.p.h.; and the third, again a two-stroke, had a speed of 46.90 m.p.h. Honours may therefore be said to be fairly even, although the two-stroke shows strongly ascendant tendencies.



Overhead valves are not yet fully popular on touring models but on sports machines they invariably find a place when maximum efficiency is sought. The o.h.v 250 c.c. Coventry Eagle.



After prolonged experience with the overhead valve type for racing work the Blackburne designers returned to the side valve pattern this year. The new 250 c.c. O.K.-Blackburne signalised its first appearance at Brooklands by covering 400 miles at 56·67 m.p.h. in the hands of W. Handley and W. D. Marchant.



Pioneers of a utility two-stroke engine for moderate priced machines, the makers of the Villiers will introduce two models of less than 250 c.c. capacity next year.

It must be borne in mind that practically all the performances mentioned have been achieved on specially prepared machines in the hands of a comparatively small number of expert riders; the small machine no doubt demands more than a usual amount of nursing in these strenuous events, but it must not be forgotten that the special production of to-day becomes the touring model of to-morrow.

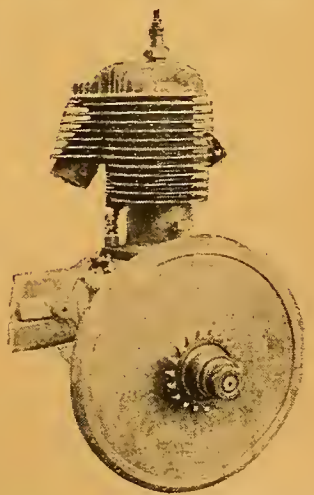
When machines of just under 250 c.c. capacity have proved themselves capable of surviving the International, the Scottish and the English Six Days Trials with credit and honours, when five different makes can average more than 45 m.p.h. over the mountainous T.T. course, when one can average over 44 m.p.h. for twenty-four hours at Brooklands and another maintain 52½ m.p.h. for 166 miles in the French Grand Prix, can the ultimate reliability and suitability of the type for ordinary purposes be doubted?

Surely the 250 c.c. engine promises the solution to the problem of providing a cheap, light and economical motor cycle to fulfill all reasonable needs.

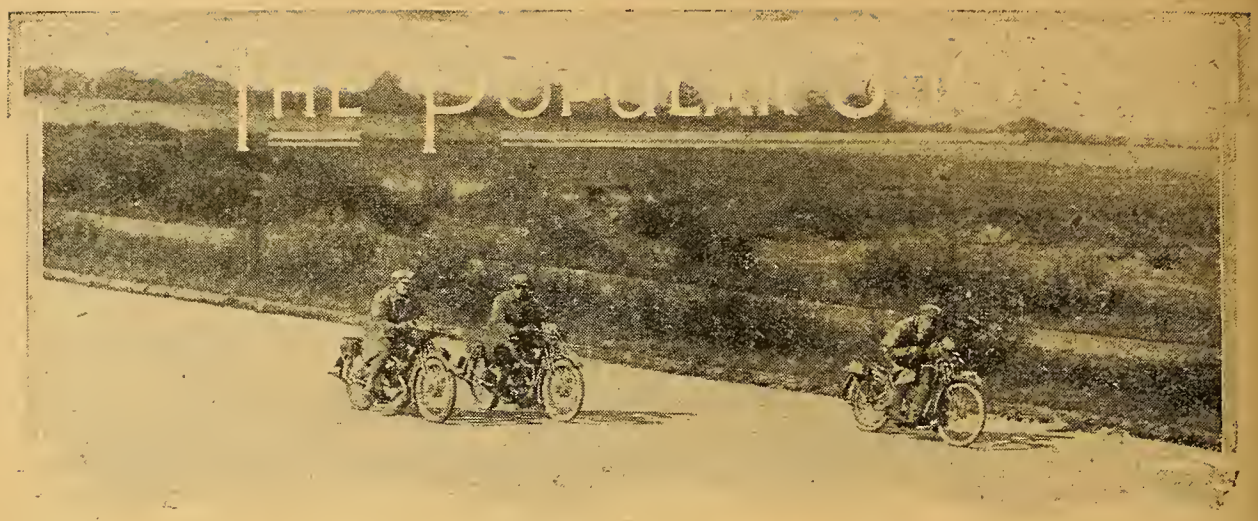
Choice Available.

Those riders who now realise that the 250 c.c. mount will meet all reasonable requirements have a wide and varied choice of machines before them. These will be fully dealt with in our Show forecast and report issues, and will include such well-tried two-strokes as the Levis, Velocette, Sun-Vitesse, New Hudson, Triumph Enfield, Cedos, Ivy, Verus, James, Radco, and the many Villiers engined models as the Wolf, Hobart, Sparkbrook, and Excelsior.

The four-stroke range is even wider, most, however, having proprietary engines such as Blackburne or J.A.P. These include: New Imperial, Rex-Acme, Sirrah, Coventry Eagle, Sheffield-Henderson, Weatherell, Diamond, Invicta, Trump, Ariel, Ivy, and Dot.



Enormous cooling fin area on the cylinder is a special feature of the 250 c.c. Blackburne unit.



A Class with an Increasing Number of Representatives. Tendency of 350 c.c. Machines to Replace the once Universal 500 c.c. Utility Mount.

IN spite of the enormous popularity of the 500 c.c. single, which as a type has probably had a longer vogue than any other form of motor cycle engine, the 350 c.c. engine has shouldered its way to the front.

As is usually the case, practical developments along smaller lines were foreshadowed by Brooklands records until, finally, the 1920 Senior Tourist Trophy was won by a 350 c.c. machine—a performance such as had never been accomplished previously, and, we may risk the prophecy, will never be accomplished again.

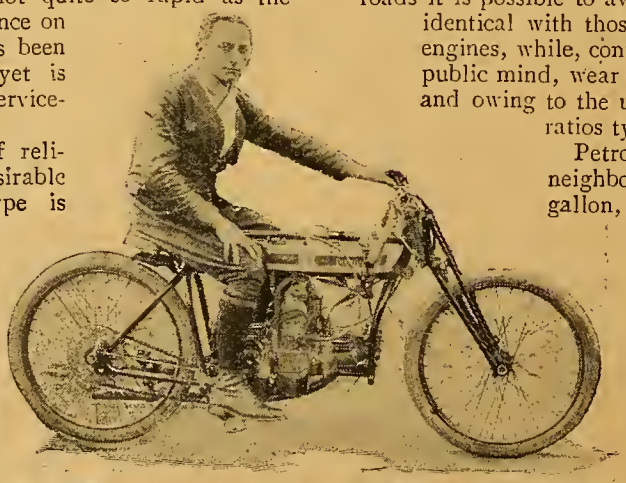
Early Propaganda.

When a new type comes to the front, it is usually brought into prominence by some apparently miraculous performance in a speed trial. To begin with, the public are sceptical, pointing out that the miniature engine has features which are not likely to appeal to the private owner. Developments and modifications of the racing machine bring the later models within the scope of practical politics, until finally a machine is evolved which, though not quite so rapid as the racing type, is a great advance on anything of its size that has been produced previously, and yet is perfectly roadworthy and serviceable.

Finally a long course of reliability trials weeds out undesirable features until the new type is capable of performances as good as those of a larger type of only a few years ago. Such has been the history of the 350 c.c. machine of to-day.

It is almost impossible to give the credit to any particular firm for developing the 350 c.c. engine, for progress has been so gradual that many well-known names are concerned. Nevertheless, it is only fair to remember the wonderful performances of the early flat-twin Douglas, which has done so much to popularise the light machine.

In spite of the good work of the pioneers, the majority of modern "350's" are of the single cylinder type, but include variations from the simple three port two-stroke through the normal side-by-side valve engine, to the highly efficient overhead valve racing machine—the Douglas and the Wooler being the only twins still obtainable in the 350 c.c. class.



C. G. Pullin, who has attained a speed of 94·79 m.p.h. on a 350 c.c. Douglas.

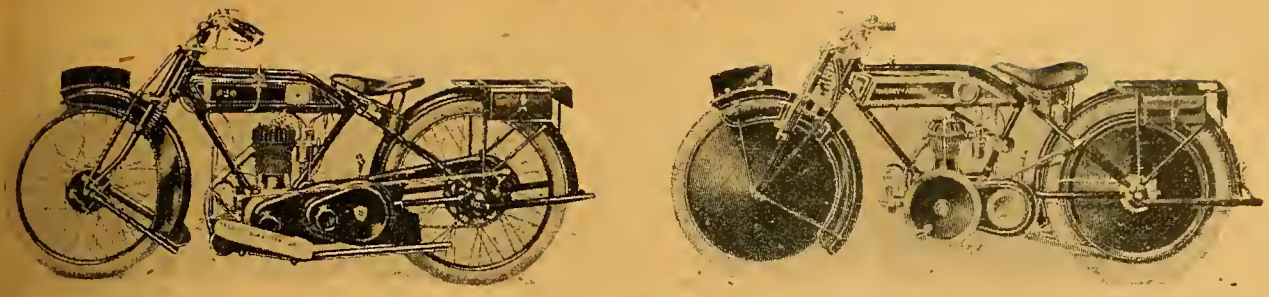
Qualities of Medium Size Machines.

In power and reliability 350 c.c. machines have proved themselves in all the big reliability trials, and long and steep hills can be ascended with consummate ease, without the faintest symptoms of overheating or loss of power.

Handiness is another feature in which these comparatively light machines score heavily, and over twisty roads it is possible to average speeds which are almost identical with those obtainable with much larger engines, while, contrary to a common belief in the public mind, wear and tear is not unduly heavy, and owing to the use of comparatively low gear ratios tyre wear is far from great.

Petrol consumption should be in the neighbourhood of 100 miles to the gallon, and oil consumption is reasonable, though if high speeds are to be maintained plenty of oil of a first-class brand is an economy rather than otherwise.

Public performances count for much, and the growth of the speeds in the Junior T.T. Races shows the remarkable development of sustained power which has taken place



Two 350 c.c. machines which, in the overhead valve form, have made reputations in the Tourist Trophy Races. (Left) The A.J.S. (Right) The Massey Arran with Blackburne engine.

during the past few years. On two occasions it will be noticed that a considerable drop in speed took place. In 1911 the late P. J. Evans's performance was so wonderful that the 1912 winner was unable to equal it, and the drop in 1920 may be credited to the unpreparedness of manufacturers, and works dislocation, caused by the war and subsequent events.

Past T.T. Speeds.

In 1911 the late P. J. Evans, riding a 340 c.c. twin Humber of 60 × 60 mm. bore and stroke, averaged the wonderful speed of 41½ m.p.h., and over the same course in the next year W. H. Bashall on a 348 c.c. Douglas of 60.7 × 60 mm. bore and stroke failed to maintain the previous year's record, and averaged only 39.65 m.p.h.

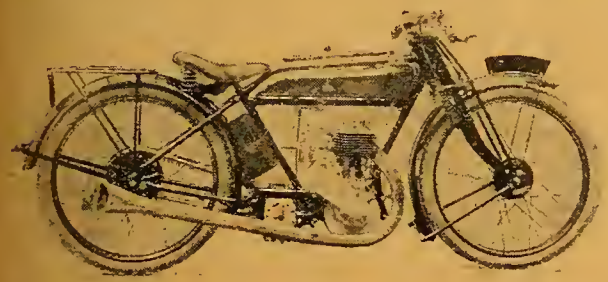
In 1913 the length of the course was increased, but in spite of this Hugh Mason (344 N.U.T.) increased the average speed to 43.73 m.p.h.; and in 1914 Eric Williams on a single-cylinder 349 c.c. A.J.S. of 74 × 81 mm. bore and stroke again raised the figure to 45.6 m.p.h.

The next race was held in 1920, and the average speed again dropped considerably. On this occasion the race was one of the most extraordinary that ever occurred, for the winner, Cyril Williams, mounted on a 349 c.c. A.J.S., finished the last two or three miles by pushing, yet succeeded in coming home first at an average speed of 40.74 m.p.h.

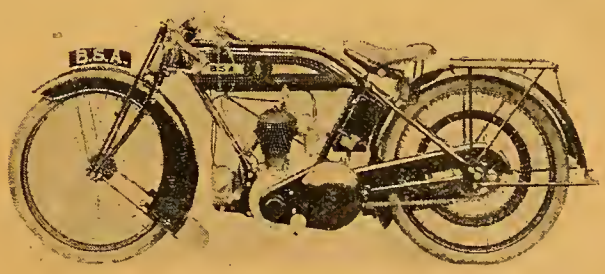
During the subsequent year lessons learned owing to experimental work during the war had had time to take a practical form, and in 1921 Eric Williams (349 A.J.S.) achieved a wonderful average of 52.1 m.p.h. It should be noted that the machine on which this race was won was very similar to that used in the previous year, though in 1920 the power developed by the cylinder was such that various other portions of the engine and transmission were not sufficiently sturdy to withstand the strain.

Winner of the Senior Race.

In 1921 also H. R. Davies on an exactly similar machine accomplished the truly marvellous performance of winning the Senior event at a speed of 54.49 m.p.h., a speed which was slightly bettered in the Junior Race in 1922 by T. M. Sheard, again mounted on a 349 c.c A.J.S., the average working out at 54.75 m.p.h.

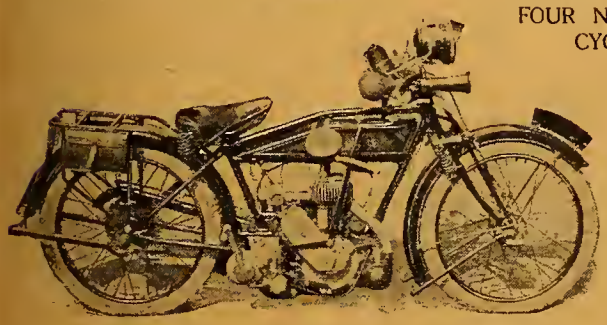


New Hudson

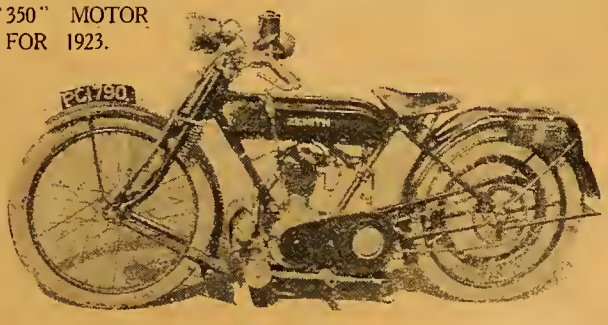


B.S.A

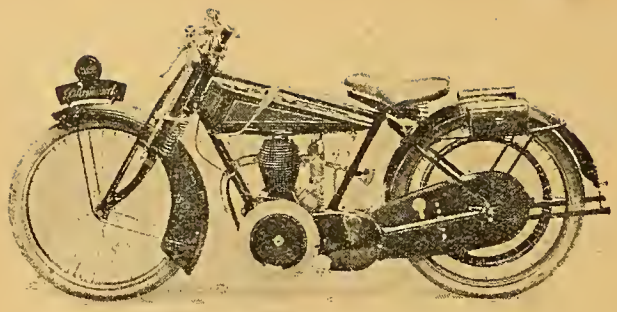
FOUR NEW "350" MOTOR CYCLES FOR 1923.



James.



Zenith-Jap



A Diamond with a Barr & Stroud sleeve valve engine.

In the meantime one must not lose sight of two-stroke developments, for by 1922 the average speed of P. A. Newman's 349 c.c. Ivy had reached 46.08 m.p.h., or sufficient to win any T.T. previous to 1921.

It will be noticed that the A.J.S. firm has had an extraordinary run of victories in the Tourist Trophy Races, yet they are by no means alone in being able to manufacture fast and reliable 350 c.c. machines. Such well-known engines as the 346 c.c. J.A.P. and 348 c.c. Blackburne have done wonders in developing the modern tendency towards smaller engines. More than once the A.J.S. has been hunted home, and such machines as the Massey-Arran, Sheffield Henderson, New Imperial, Blackburne, Coulson, Cotton, Edmund, Dot, in addition to our old friend the Douglas in its sporting form with overhead valves, have made performances sufficient to cause the winner to put forth his best efforts.

In the 500 Miles Race at Brooklands two-stroke enthusiasts were rewarded by seeing Norris's Ivy top the list in the 350 c.c. class—a performance which shows the sturdy reliability of the modern high-speed two-stroke. Nevertheless, until recent times the Ivy has remained one of the few two-strokes having so large a capacity. Other competitors in this department, however, are the Beardmore-Precision, Connaught, Alecto and, more recently, the Villiers.

Brooklands again gives ample proof of the phenomenal capabilities of the modern 350 c.c. machine. Below we give the existing figures for long and short distance records :—

Kilometre	C. G. Pullin	Douglas	94.79 m.p.h.
Mile	H. Le Vack	New Imperial-Jap.	91.88 ,,
5 Miles	H. Le Vack	New Imperial-Jap.	83.49 ,,

6 Hours	Tudor Thompson	Douglas	60.45 ,,
12 Hours	J. S. Holroyd	Blackburne	50.20 ,,

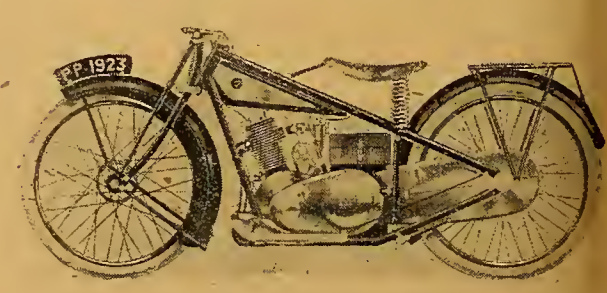
Apart from high-speed records, which (though of the utmost importance in the development of a type, especially when accomplished over long and difficult courses such as that employed in the case of the Tourist Trophy Races) are not always followed with such attention as they deserve by the touring rider, it must be obvious from the number of well-known firms specialising in 350 c.c. models, or which at least have added a machine of this size to their range, that the smaller type has found a very definite place in the market.

The latest additions from works which produce an entire machine are the Raleigh, James and New Hudson and Beardmore-Precision, while other famous names are whispered. The makers of the Sunbeam, who before the war used to produce a most admirable 350 c.c. model, have again decided to enter the lists, which will come as no great surprise to those who have watched with interest the 350 c.c. Sunbeam with overhead valves, which, under the able pilotage of George Dance, has made itself dreaded by all speed men.

Two Newcomers.

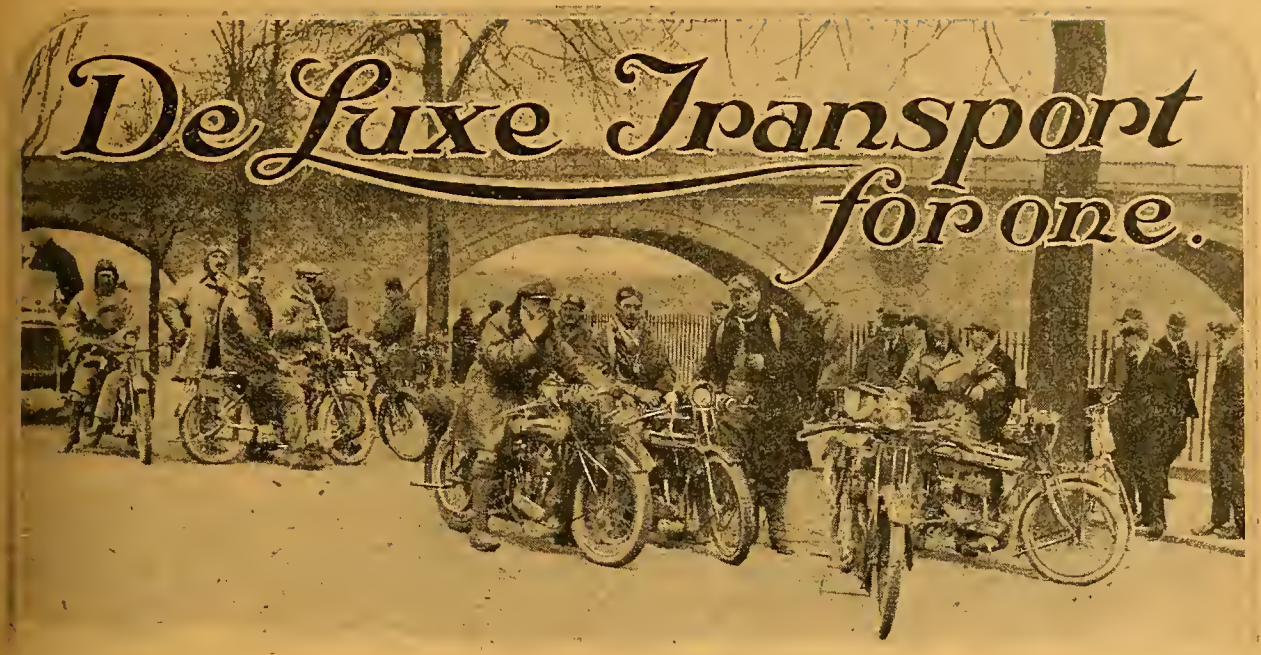
An important development, likely to affect all sizes of engines, was the introduction of the 350 c.c. Barr and Stroud engine, with its single sleeve valve and its silent operation. This engine is growing in popularity and is gaining even further laurels for its class engine, while the 350 c.c. o.h.v. Bradshaw oil-cooled engine is also making steady headway.

Amongst the normal side valve 350 c.c. engines which are fitted to many excellent machines must be mentioned the Blackburne and J.A.P.



The P & P., to be known as "The Silent Three."

De Luxe Transport for one.



Why the Larger Type of Solo Machine persists. Its Undeniable Charm. The Choice Available. Representative Machines Illustrated.

IN view of the rapid developments in small air-cooled engines during the past year or two and the success of the "lightweight" in all its forms as a capable roadworthy touring machine it may well be asked if there is any justification for a solo motor cycle with an engine larger than 350 c.c.

As a matter of fact the question is frequently raised in our Correspondence columns—and would crop up more frequently still but for a watchful sub-editor. But just as often is a complete answer supplied by enthusiastic riders of the larger machines.

Experience Counts.

This recurrent controversy among our readers in itself indicates very clearly how the whole matter stands. Not only is one man's meat another man's poison; one man often *imagines* that another man's meat would poison him. Would he but sample it his views might alter considerably.

The 250-350 c.c. enthusiast knows that he has a wonderfully efficient machine which he very seldom dares "open out" fully, which climbs every hill he puts it to without faltering, and which gives him day in and day out service at a very minimum of trouble and expense. Why, he asks, should anyone desire anything more powerful?

He does not realise, however, that the same argument applies to motor cars—Fords at £175 against Rolls-Royces at £3,000; to houses—two-roomed bungalows at £300 against "desirable villas" at £3,000; to cigarettes, to drinks, to anything. The more one pays the greater the refinement obtained.

In the motor cycle world, however, one gets more than mere refinement by buying from among the larger machines.

By Comparison.

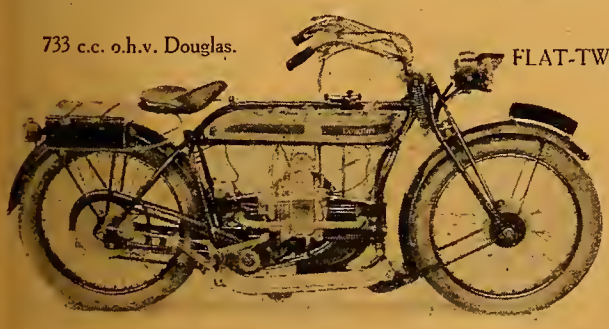
As has been pointed out in our columns, the 250-350 c.c. machine gains much of its efficiency at the expense of fussiness, a defect only noticeable by comparison.

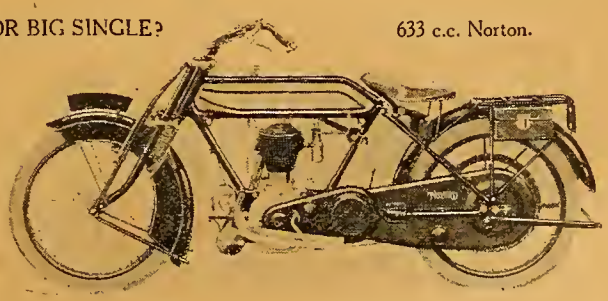
Fussiness; as exemplified by a screaming engine, is most unpleasant to a great many riders. Additionally it is a symbol of more rapid wear than the

733 c.c. o.h.v. Douglas.

FLAT-TWIN OR BIG SINGLE?

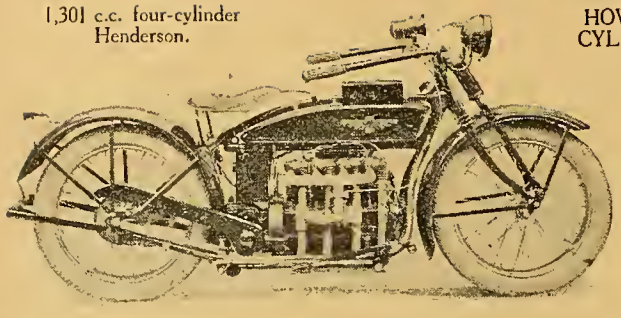
633 c.c. Norton.



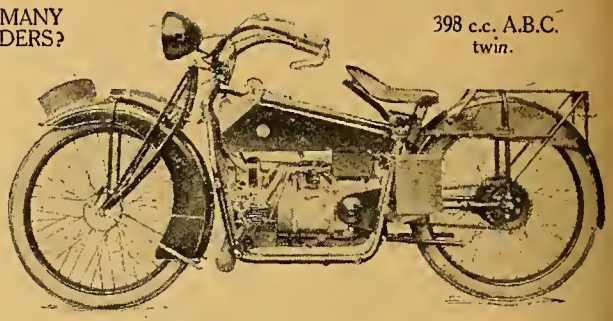


HOW MANY CYLINDERS?

1,301 c.c. four-cylinder Henderson.



398 c.c. A.B.C. twin.



effortless gait of a big single or twin moving at an identical road speed. Engine depreciation, therefore, is often less on the larger machine.

Lightness, too, is not an unmixed blessing; at certain speeds it may be synonymous with discomfort, again comparatively speaking, be it understood. The larger solo mount is (usually) fitted with larger tyres. Large tyres are easily the next best thing to a spring frame; many even prefer them. Or if a spring frame is desired there is more scope for its incorporation on the bigger machine. It also functions more ably therein.

Running costs, however, are by no means proportionately greater. Indeed, the economy of the lightweight is occasionally not so real as the figures of a freak fuel consumption test might indicate. In ordinary use the average 250-350 c.c. two-stroke runs 80-90 miles to the gallon of fuel; under similar conditions most 500 c.c. singles do 100 m.p.g. Tyres cost more in the latter case; but they wear longer. Wear and tear items should be less. Only tax and insurance are definitely greater.

Reserve of Power.

Then, a very real charm of the sturdy 500-1,000 c.c. heavyweight is that it will do more. True, it may not often be asked to exert itself, but the reserve of speed and power is there. Even if this reserve is only tapped twenty times in a year's running, the feeling of satisfaction because it is there is worth an extra pound or two.

Of course, for the type of rider known as a hard driver there is really no choice in the matter. He must have the big machine. Judging from the machines seen on the road the class is quite an important one.

Sixty m.p.h. 350 c.c. machines *are* obtainable, but if one really desires a 60 m.p.h. machine—and in capable hands it is a most fascinating possession—a 500 c.c. single is not much more expensive to buy; and a 1,000 c.c. twin does not cost double! Either of the latter types may be relied on to reach express train speeds after 1,000 miles neglect, or 5,000 miles with but perfunctory attention. The 350 c.c. mount might, but its maintenance of tune cannot be relied on over the same distance.

But enough—to use another homely saying—"the proof of the pudding is in the eating." Thousands of keen motor cyclists will again visit Olympia and choose solo machines of double or quadruple the bare minimum engine capacity necessary for the effective transportation of one person. Their choice will still be unlimited.

Varied Choice of Makes.

Those to whom sturdy simplicity appeals will certainly consider such famous singles as the B.S.A. (either the new sporting model or the old 557 c.c. machine), P. and M. (perhaps the new Panther), Powell, Norton (75 m.p.h. B.R.S., or even the dual-purpose "Big Four"), New Hudson (available in an attractive sports guise). Dunelt (the only big single two-stroke), Ariel, Coventry Eagle (with a very lively 499 c.c. J.A.P. engine), Quadrant (another new departure to attract the soloist), Beardmore (ditto), Rover, Sheffield-Henderson (specially attractive to the speed man), Triumph (four-valve or 550 c.c.; according to taste), 548 c.c. Wolf or 550 c.c. X.L.

In the neighbourhood of 400 c.c. there are the 398 c.c. A.B.C. flat-twin, the 370 c.c. two-stroke Connaught, the 375 c.c. Royal Ruby, and the 398 c.c. Raleigh.

Twins of 500 c.c. capacity are not so numerous, but he would be indeed hard to please who could not find one suitable among such a varied range as the 494 c.c. Douglas, 496 c.c. Brough, and 498 c.c. Zenith-Bradshaw flat-twins, or the 500 c.c. N.U.T., 498 c.c. Martinsyde, and 496 c.c. P.V. V-twins, or the water-cooled 481 c.c. Scott Squirrel two-stroke twin.

V and flat-twins with engine capacities in the region of 750 c.c. are available from many factories in several

FAVOURITES WITH THE SPEEDMAN.

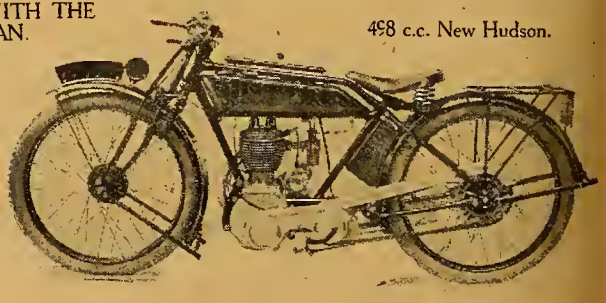
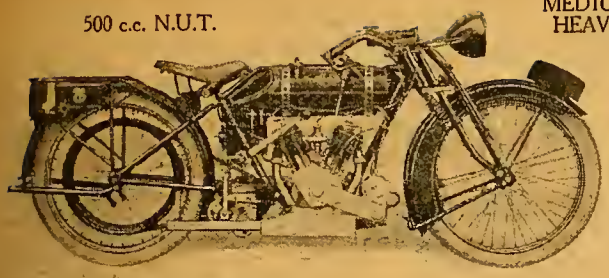
498 c.c. New Hudson.

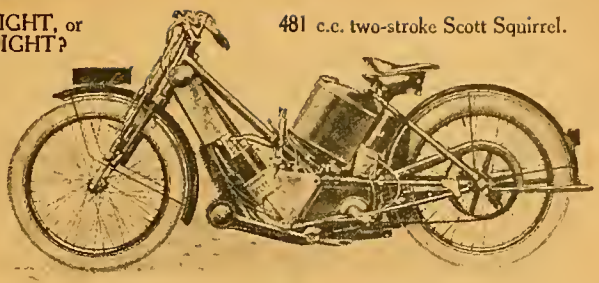


MEDIUM, LIGHT, or HEAVY WEIGHT?

500 c.c. N.U.T.

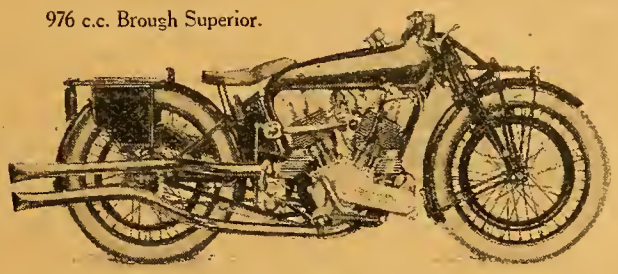


481 c.c. two-stroke Scott Squirrel.



forms. For example, there are the 600 c.c. Humber, 698 c.c. Raleigh, 688 c.c. Coventry Victor, 733 c.c. Douglas, 688 c.c. McKechnie, 692 c.c. Brough, and 584 c.c. Harley-Davidson flat-twins, and the 749 c.c. Bradbury, 596 c.c. Indian, 592 c.c. Lea-Francis, 678 c.c. Martinsyde (or "Quick Six"), 678 c.c. N.U.T., 680 c.c. Omega, 770 c.c. B.S.A., 654 c.c. Zenith (such as "Zenooth" writes about), and 550 c.c. Coventry Eagle V-twins, and the larger Scott and the V-twin two-stroke Stanger.

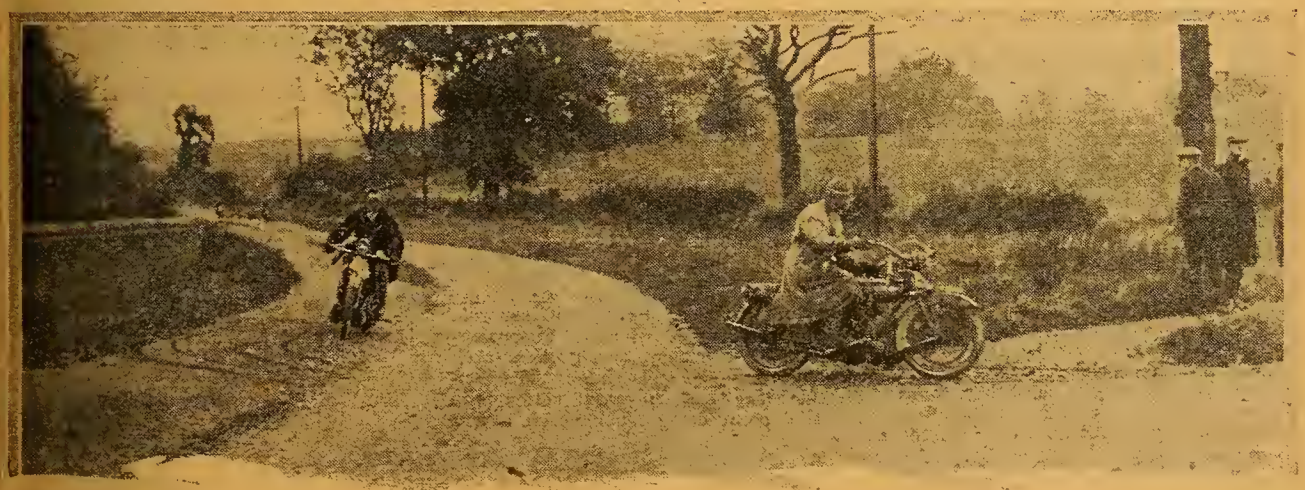
976 c.c. Brough Superior.



Full-size, full-blooded big twins are available in greater variety than ever. (What better argument could there be against the alleged uselessness of the type?) There is, in fact, a marked tendency in many quarters for makers to concentrate on a tiny lightweight and a full-grown model of sports type.

Britain, a few years late, has stepped into an arena held mainly by America. But no comment is required upon such desirable productions as the "S.S.80" Brough-Superior, the 976 c.c. solo Matchless, the belt or chain-driven big Zenith, the New Imperial, the belt or chain-driven Rudge, the D.O.T., the Packman or the Trump-Anzani. America, however, will always hold a strong position on this market so long as she is represented by the Indian, the Harley-Davidson, the American X and the Reading-Standard. All of them are imposing solo mounts.

For a four-cylinder we must go abroad, not literally, of course, to Belgium for the F.N., to America for the Ace or the Henderson. Those who have ridden these two last-mentioned rightly claim that the experience is a memorable one.



KEEN UNDERGRADUATES. Great enthusiasm was shown at the Cambridge University M.C.C. trial, described last week, which attracted 46 starters. Two of the earlier competitors near Markyate.

THIS YEAR'S LONDON-EXETER RUN.

SEVERAL innovations will be made in the M.C.C. London-Exeter run this year. The route has been somewhat stiffened.

The start will be from the Bridge House Hotel, Staines, on Tuesday evening, December 26th. The outward journey will be *via* Staines, Bagshot, Basingstoke, Salisbury, Shaftesbury, Yeovil, Chard, Honiton, Sidmouth, Peak Hill, to Exeter, the return being *via* Salcombe Hill, Lyme Regis, *Bridport, Beaminster, White Street, Maiden Newton*, Dorchester, and Blandford, to Salisbury, and then by the outward route in the reverse direction to Staines. The italicised portion is a change from last year.

The conditions have also been made more difficult, and any competitor found to be more than ten minutes ahead of time at any point on the route will be disqualified.

There is a stringent rule regarding silencers.

ELECTRICITY & THE MOTOR CYCLE.

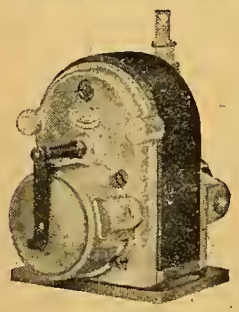
Electrical Apparatus for Lighting and Ignition.
Recent Developments in Magneto Design.

ELECTRICITY is an indispensable servant of the motor cyclist.

It is largely owing to electricity that internal combustion engines became a practical possibility. Tube ignition had a short and merry life, catalytic ignition has been tried and found wanting, ignitions have even been made to work with the pyrophoric metal, or "flint," we use in our cigarette lighters, but electricity has won through and reigns supreme.

Ignition Systems.

First, therefore, must we deal with magnetos and other electric ignition systems, then electric lighting, and finally electrical accessories.



C.A.V. magneto for single cylinder engines.

The old battery and coil system was a failure; sometimes it worked well, often it worked indifferently, and sometimes it did not work at all. Current was derived from an accumulator which rarely held its charge; then there was the contact breaker, which demanded frequent attention, and lastly a multiplicity of terminals, of which one or more often came loose.

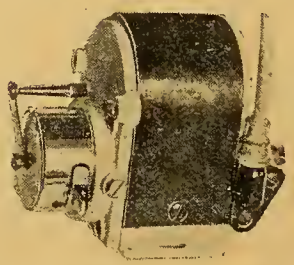
It is no wonder, therefore, that the magneto revolutionised motor cycling, once it proved itself. At its introduction the magneto had much prejudice to overcome, for many thought that they could put the old system right if it failed, but if a magneto gave out . . . ? But the magneto survived the test; it showed itself to be the most reliable part of the machine. A really wonderful triumph, converting the most unreliable part of the machine into the most dependable: it did more—it saved the motor cycle at the most critical period of its history.

Before the war one make of magneto was almost universal; it was a superb piece of work, the father of all magnetos, consisting of permanent horse-shoe magnets, an armature wound with low and high tension windings, a collector or distributer, a condenser, and a contact breaker.

Since the war most British-made magnetos followed the accepted principles, and there are many excellent examples, modified and improved in detail, but following the lines of their prototypes such as the Fellows, E.I.C., B.T.H., C.A.V., and others.

Progress of Magneto Design.

The more enterprising firms, however, have improved the magneto almost out of recognition, both mechanically and electrically. The latest M-L pattern, for example, although having armatures of standard type, have two separate cobalt steel magnets of small dimensions but of high efficiency, separated at each end by laminated pole shoes. The contact breaker has an axial action, the movable point being mounted on a leaf spring forced outwards for the break by a tappet actuated by a face cam.



Reliability and good finish are to be found in the Fellows magneto for twin-cylinder engines.

Further improvements for 1923 are a new method of attachment of the contact breaker cover, so as to render the magneto more thoroughly dust and waterproof, while the laminations forming the pole shoes are now punched accurately to size, so that it is no longer necessary to machine the bore of the tunnel. A new pattern M-L magneto has now been produced which has staggered pole shoes and is suitable for 90° engines.

Sectional view of the M-L C.M. type, magneto, showing laminated pole shoes, collector ring, and contact breaker.

Quite a different principle is found in the B.L.I.C., in which the armature is stationary and the magnet rotates. Again, a great saving in weight results from the use of cobalt steel for the magnet, and the model for single-cylinder engines only weighs 3½ lb. Amongst the advantages of this construction are fewer working parts, a stationary contact breaker, freedom from centrifugal stresses on the armature at the high engine speeds now obtaining, and excellent sparking at low r.p.m.

C.A.V. dynamo and electric lighting fittings.

There is yet another type of magneto, that contained in the flywheel. The best known is the Villiers. Apart from giving a reliable current for ignition purposes, a supplemetary coil for lighting the lamps may be incorporated.

For ignition purposes the flywheel magneto consists of two portions; the inner an aluminium plate, frictionally held on an extension of the mainshaft bush, while the outer is a bronze flywheel keyed to the engine shaft and carrying two semi-circular permanent magnets, held in place by laminated pole shoes. On the aluminium plate are the armature, its coil, and the stationary contact breaker, which is actuated by a cam on the flywheel boss.

Lastly, there is yet another system of ignition, by dynamo battery and coil, which, although popular in America, especially in the car world, has not yet taken hold of the British motor cycle market. Rotax, Ltd., however, construct a lighting and ignition set of this pattern for motor cycle use. In principle it is the same as the old system of years ago, but improved in detail and with the important difference that a current is always passing through the accumulator from the dynamo, thus keeping the former always up to the mark. Naturally the current derived is also used for lighting the lamps.

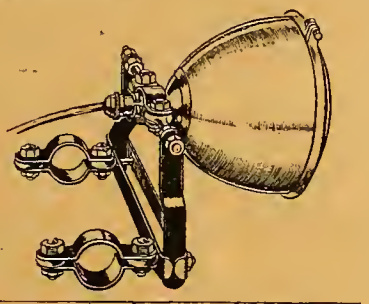
Sparking Plugs.

A most important part of the ignition system is the sparking plug—how important few motor cyclists realise. Many engine troubles which are experienced are due to pre-ignition caused by bad plugs. Engines which fail under heavy loads, as when driven hard on the level or run at high speeds on low gear, almost always fail through the plug points becoming incandescent.

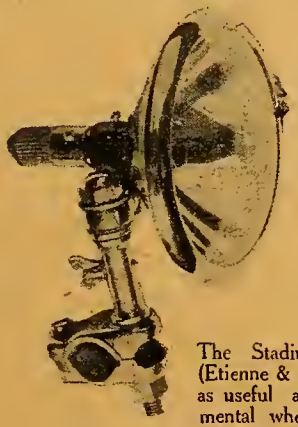
Fortunately, manufacturers of sparking plugs are giving this important matter their attention, and many of the more reputable sparking plug makers produce articles which will stand the abnormal conditions produced by modern high-efficiency engines. Other important features of a desirable plug are detachability for cleaning, soundness of insulation, and waterproofness.

Insulating Materials.

In modern sparking plugs the most popular insulators are steatite and mica. Among the more noteworthy of these important ignition accessories are the K.L.G., mica-insulated H.1 pattern, which is detachable, and specially constructed for hot-running engines; the Binks, which has a steatite insulator and is detachable for cleaning; and the Forward, in the case of which the user may have the choice of either type of insulating material or both, as in the case of the new model B. An excellent feature in this plug is its waterproof terminal, which is safe from short circuits in wet weather, so likely to occur in the case of an engine which carries the plug or plugs in an exposed position. Bluemels have produced a sparking plug (model S.), equipped with pure nickel electrodes and designed specially for two-stroke and other engines which run hot, while the Hobson Manufacturing Co. has placed on the market two types of plugs. Nos. 328 and 331, specially designed to give absolute freedom from pre-ignition. These have hemispherical central electrodes of pure nickel, while the mica insulator is compressed under two tons pressure. These plugs are detachable, and are claimed to remain gastight under all conditions. Other excellent plugs which are extremely popular among motor cyclists, the Lodge and Sphinx, are highly suitable for modern efficient engines.



Universal lamp bracket marketed by the Astra Dynamo Co. Below are the various positions which it enables the lamp to assume.

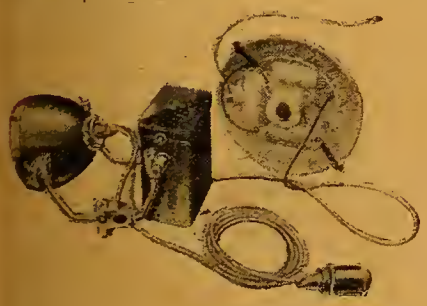


The Stadium spotlight (Etienne & Co.) which is as useful as it is ornamental when fitted to a motor cycle handlebar.

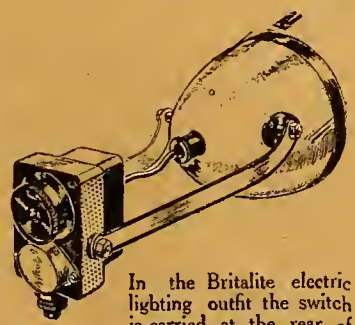
Lighting Systems.

Electric current for illuminating lamps is obtained from dry batteries, accumulators, a dynamo, or more usually from a dynamo *via* an accumulator.

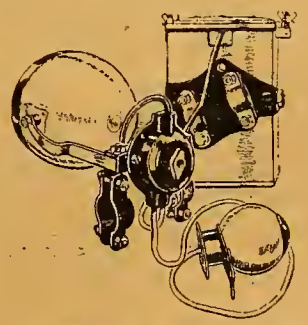
Dry battery lighting is very convenient, especially in the case of those who ride in well-lighted areas for short distances, as this source of current behaves at its best when on intermittent work, since it



Villiers lighting installation with lamps, dry battery and flywheel magneto-generator.



In the Britalite electric lighting outfit the switch is carried at the rear of the head lamp bracket.



Few lighting switch positions could be more convenient than that adopted in the Miller accumulator lighting.

Electricity and the Motor Cycle—

recuperates slightly after a rest. If suitable bulbs are used and the lamps are not kept alight for too lengthy periods, excellent service may be obtained.

Few firms have given this system of lighting more careful thought than A. H. Hunt, Ltd., whose Hellesen batteries give splendid service, and whose catalogue possesses some capital wiring diagrams which the buyer would do well to study.

Usually dry batteries or accumulators are carried in cases which occupy the same position as an acetylene generator, but when a sidecar is attached, larger batteries are required, and the sidecar locker is generally utilised.

When it is necessary to obtain an especially good light for lengthy periods an accumulator gives the better service. But accumulators need constant attention, and if not changed regularly once a month they are apt to deteriorate, consequently this system is not advocated for the rider who has not charging facilities near at hand.

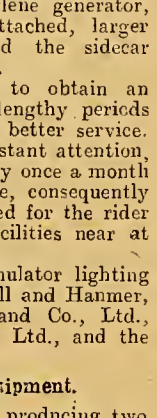
Good examples of accumulator lighting sets are produced by Powell and Hanmer, Ltd., C. A. Vandervell and Co., Ltd., A. H. Hunt, Ltd., Dekla, Ltd., and the Astra Dynamo Co.

Self-generating Equipment.

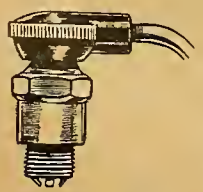
Dynamos are capable of producing two different kinds of current according to their construction—alternating or continuous. The former is used for lighting direct from the dynamo and will not charge an accumulator, while with the continuous current machine the accumulator is nearly always being charged so long as the machine is running and the lamps are lit from the accumulator.

Most of the smaller sets driven off one or other of the motor cycle wheels are of the alternating variety, and so is Villiers' flywheel generator. In cases of this kind a dry battery is included, which is brought into use when the machine is at rest.

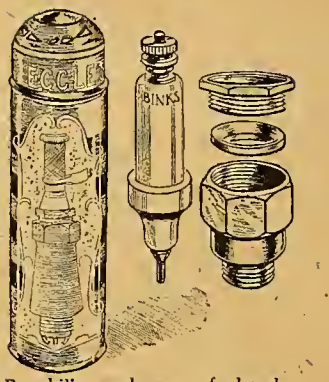
With the Villiers (V.E.C.) the voltage is constant at speeds of over 25 m.p.h., so there is no danger of burning out the bulbs. Two lighting coils, which have no electrical connection with the ignition coil, are added to the flywheel magneto. They are connected in series with each other, the end of one coil being "earthed" to the armature plate, while the free end of the other is led to the lighting terminal. As the magneto rotates the magnetic flux passing through the iron of the armature is constantly varying. The circumference of the armature is broken by four gaps, each equal to the length of the pole shoe. When the pole shoe passes over one of these gaps the flux variation is very rapid and generates current in one or other of the coils; by arranging that no two of the gaps are diametrically opposite, one current impulse occurs before the other, so that no interference results.



In cases where the fitting of a compression tap is inconvenient the Lodge priming plug will be found to be a real boon; it enables petrol to be injected through the central electrode.



Complete weather protection for the plug is given by the Forward waterproof terminal.



Portability and ease of detachability for cleaning are desirable features of the Binks plug.

Another magneto lighting system is embodied in the B.T.H. Sparklight set, which is suitable for single-cylinder two-strokes. Surplus current is taken from the magneto at the maximum position of the armature which is not used for ignition. This is done by means of an extension of the contact breaker casing containing an insulated segmental track and a centrifugally controlled brush connected to the primary winding. The segment is so placed that the circuit is only complete during the building up of the idle voltage wave, and consequently the ignition is not affected. By this system it is possible to put a small charge through the accumulator which is always on charge by day; but when the lamps are in use there is a small discharge through the battery of .25 amp. A later model has been brought out to work with four-stroke engines, also a mag-generator and a flywheel magneto have been introduced by this firm.

Combined Ignition and Lighting.

No article on electricity for the motor cycle would be complete without a reference to the M.L. Maglita. This machine has only one rotating member, and that is an H-section armature with a low tension winding and a two-part commutator which rectifies the alternating current first generated into a charging current for lighting the lamps and charging the accumulator. The ignition system is quite independent of the battery, so that if the latter is run down the engine can be started and run normally and efficient lighting obtained so long as the engine is running. Current for the ignition is generated in the low tension and high tension windings wound round the stationary laminated iron core, forming a bridge between the upper ends of the two pole shoes of the machine. The ignition windings are brought into the magnetic circuit by the rotation of the lighting armature, which acts in a similar way to the rotor of a polar inductor type of magneto. The ignition system, including the contact breaker, is stationary, the face cam for the latter being mounted on the armature.

A new model specially adapted for sidecar use has been introduced, in which the battery is carried in the sidecar and not on the handle-bars. Improvements consist of a freshly designed contact breaker of which the points are visible and accessible at practically all positions. The face cam has been replaced by a radial one and the push rod is of square section, giving long life and a square lift to the contact breaker blade in any position of advance or retard. A dimming device has now been added to the 7in. head-lamp. A junction box is provided which is fitted to the motor cycle on the sidecar side, two permanently attached wires coming from the top of the box and two detachable wires from the bottom, one for the sidecar lamp and the other for the battery. These plugs are further locked inside the box with set screws. With this arrangement there are no loose wires on the motor cycle when the sidecar is detached. This set can be used for solo work by running the lights directly off the generator, which is self-regulating. The light can only be obtained when the engine is running and the dimming switch must not be used, but for normal solo riding the standard set, with the battery on the handle-bars, is recommended.

Dynamo Lighting.

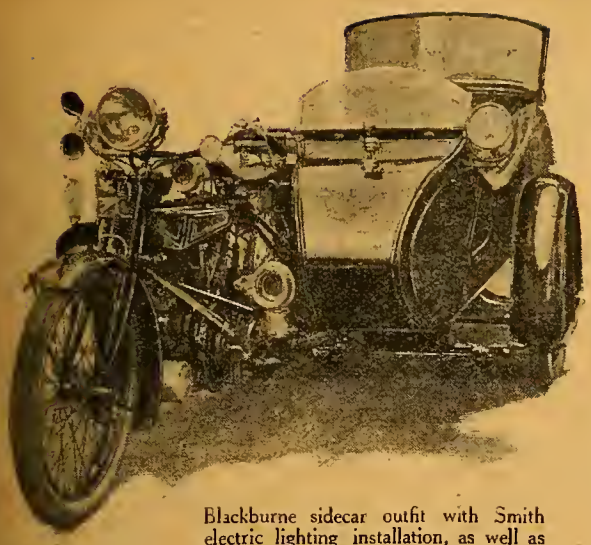
We now come to the more conventional dynamo installations, in which a dynamo giving a continuous current charges an accumulator from which current to the lamps and horn is taken. A cut-out, usually magnetic, is supplied for the purpose of breaking the dynamo circuit at low engine speeds so that the latter cannot discharge through the dynamo. There is little danger of over-charging, which, if not excessive, merely results in "gassing" of the accumulator; precautions against too rapid charging are always taken to the design of the set.

One of the most popular equipments is that made by the Lucas Electrical Co., Ltd., of super-excellent finish and design. In the case of the Lucas either a separate dynamo, driven off any suitable rotating portion of the engine or transmission, or the Lucas Magdyno may be used.

With this latter the lighting dynamo is still a separate unit, but it is driven off the magneto, being housed within the bend of magnet above the magneto armature housing.

Pioneers in the dynamo system of lighting on motor cars, C. A. Vandervell and Co., Ltd., have only lately issued a lighting set for motor cycles. Needless to say, it holds a first-class position as regards finish and reliability. The 6-volt

The V.E.C. (Villiers) lamp, complete with focussing arrangements.



Blackburne sidecar outfit with Smith electric lighting installation, as well as with every other motor cycle accessory of the same make.

dynamo is neat and small, but efficient, while the lamps are of graceful design. There are two alternatives for carrying the battery—behind the head lamp or in a case clipped to a convenient frame tube. The new switch box, which is intended to be attached to the top tube and includes the fuse, is a very neat piece of work.

Considerable thought has been devoted by those old-established lamp makers—Powell and Hanmer, Ltd.—to their motor cycle electric lighting set. Two patterns of motor cycle dynamos are sold by this firm, the D. type, 6 volt, 6 amps. (36 watts), and the D.S. for smaller machines, 6 volt, 4 amps. (24 watts). Too great an output is obviated by means of the firm's patent clutch contained in the driving pulley, which slips when the armature speed becomes too high. The

The H.H. garage hand lamp lit by the almost inexhaustible Hellesen dry battery.

latest P. and H. electric head lamp is a beautiful piece of work, having an absolutely smooth exterior, a 6in. diameter front and a substantial bracket. Particularly neat is the handle-bar switch, which is circular and surrounds the ammeter. It includes a dimming device.

A rather more simple installation than the foregoing; especially as regards the drive, is that made by the Britannic Electrical Co., Ltd., and known as the Britalite. In this case the dynamo may be driven by friction off an outside flywheel, and an adjustable bracket is provided with a spring device for regulating the tension. Or if ordinary belt drive is desired, another and more suitable bracket is supplied. The battery box is of aluminium, is carried in the same manner as an acetylene generator, and to it are attached the switch and automatic cut-out. When a sidecar is attached the accumulator is carried in the sidecar body and the switchboard is attached to the rearward extension of the lamp bracket. When full light is required a 12-watt bulb is put into the circuit, while there is also a dimmer bulb. The dynamo is a simple shunt-wound machine weighing under 5 lb. with the bracket. A resistance is employed so as to avoid excessive output. The standard output is 5 volt, 5 amps., but a 6-volt machine may be had if desired.

Careful design, excellent finish, and cool running are features of the Miller motor cycle dynamo. The output regulation of the generator, which is of the normal shunt-wound type, is effected magnetically, with the result that it is practically constant throughout the normal speed range. The Miller lamps and switchboard are as equally well finished and efficient as the dynamo.

Mechanical Cut-in Switch.

S. Smith and Sons, Ltd., were quite early in the field with their motor cycle lighting set. There is a slight difference in the cut-out control of the Smith generator from those used in several other dynamos. As mentioned earlier in this article, cut-out regulation is usually by means of a solenoid or electro-magnet energised by the current from the dynamo. When the voltage falls below a certain amount the magnet ceases to act and the current is cut off from the dynamo and is derived from the accumulator only. Now Smith and Sons prefer to use a mechanical cut-out as being more certain in its action. Their device is a ring type governor similar to those used on speedometers. The ring is kept at an angle by a spring, against which the ring assumes a vertical position when normal speeds are attained, and by means of suitable connections makes contact with the dynamo circuit, but when the speed falls below 950 r.p.m. the ring flattens out and the contact is broken. Smith's outfit is well finished and complete in every detail, even to the inclusion of a dimmer switch.

Quite a different system is employed in the Astra dynamo, as its makers, the Astra Dynamo Co., make use of a permanent magnet machine, which consists of a die cast housing supporting one or more tungsten steel magnets, between the pole shoes of which is a laminated armature complete with commutator and windings rotating on ball bearings. The output is controlled by armature re-action, which means that the armature as it revolves generates a reverse field in opposition to that of the permanent magnets, which increases according to the speed. Consequently, a point is eventually

For testing the plug gap, the Lodge Plug Co. has introduced this handy little accessory, which includes two gauges of different thickness.

reached when the armature field equals that of the field magnets, thus preventing the voltage rising to a dangerous degree, with the result that too rapid charging cannot take place. An electro-magnetic cut-out is employed. An interesting fitment sold by this firm is a dimmer switch incorporated in the head light lead connection. Astra dynamo electric lighting outfits are simple, well made, and moderate in price. Another permanent magnet dynamo is the E.H.C., which has a simple weighted leaf spring centrifugal cut-out.

Electric Horns.

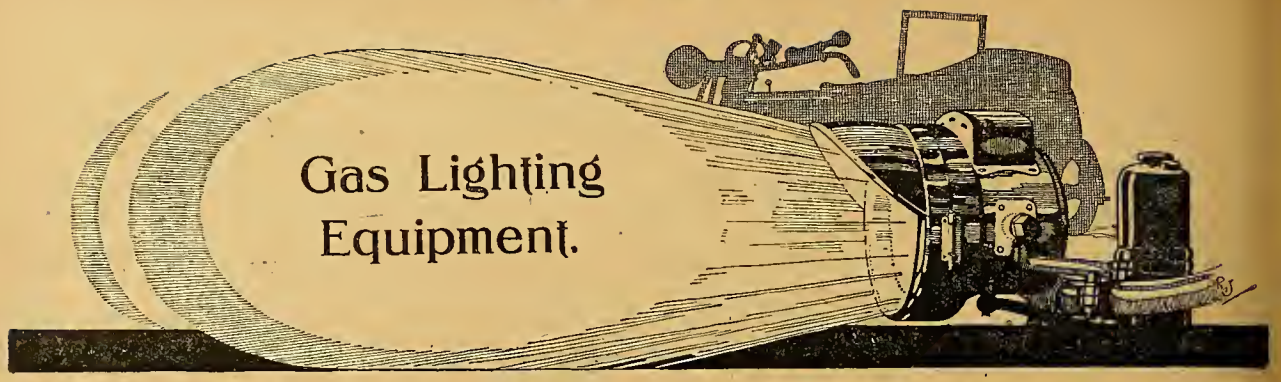
When a motor cycle is equipped with a dynamo lighting installation an electric horn is an altogether desirable adjunct, but when either a dry battery or accumulator only is carried the horn is somewhat wasteful of current, and consequently not advisable. When, however, the accumulator is always under charge from the dynamo the few ampères discharge does not matter in the slightest.

Electric horns may be divided into two classes, the Klaxon type, which consists of a motor driving a ratchet against a pin in the centre of a diaphragm, or the more common or buzzer pattern, which works on the same principle as an electric

Method of fitting the Astra permanent magnet dynamo to a Douglas.

bell, namely, the vibration of a trembler against a diaphragm brought about by the alternate magnetisation and demagnetisation of an armature.

Excellent buzzer type electric horns are made by Dekla, Ltd., The Fellows Magneto Co., Ltd., The Graham Electric Co., and The Lucas Electrical Co.

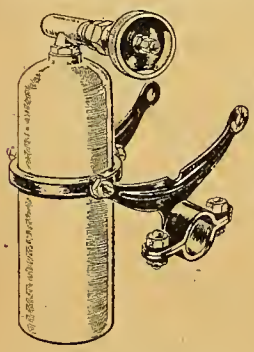


Gas Lighting Equipment.

Acetylene as an Illuminant.

ACETYLENE gas, on account of its ease of production, the cheapness of the calcium carbide from which it is generated, and the clear bright light it gives is most suitable for illuminating a motor cycle lamp.

Two forms of acetylene apparatus are available, one in which the gas is produced in a portable generator attached to the machine and the other in which ready-made gas is carried in a cylinder in a compressed and dissolved state.



No larger than and weighing about the same as an acetylene generator, the new A.L. acetylene cylinder should fill a much needed requirement.

At the present time practically all motor cycle generators work on the same principle, and there is little or no variation to those produced by the best lamp makers.

The gas is produced by allowing water to drip through a controllable needle valve on to the carbide, and the gas generated passes through a fibrous filter to the burner, usually *via* a rubber pipe.

Scrupulous cleanliness is necessary to ensure a steady and reliable light; in fact, it is advisable to clean the container and its various parts on every occasion after use.

Low's System of Generating Gas.

One of the disadvantages of the ordinary acetylene lamp is its wastefulness. The flame is usually extinguished after use by pinching the rubber supply tube (the light should not be allowed to burn out after the water is turned off if carbonisation of the burner is to be avoided), but gas continues to generate for a considerable time, that is, until all moisture has evaporated. This waste is largely obviated in the Low generator, which is designed to store the gas safely and effectively under pressure. It is much the same size as an ordinary generator, but is, of course, more strongly constructed, while the container is lined with an absorbent material which renders the compressed gas quite safe. With this generator the gas may be stored for days, and on opening the valve even after a long period a light may be had at once. When the pressure in the container reaches a certain degree the water is automatically cut off by means of a special valve.

Generating the Gas.

Dissolved Acetylene.

Quite the most satisfactory and economical method of obtaining acetylene gas is to buy it dissolved and compressed in steel cylinders. By this means the gas obtained is pure and dry, is absolutely reliable, and gives a clear, steady light. Dissolved acetylene saves all trouble in cleaning, so essential in the ordinary type of generator, as the cylinder remains in use until empty,

An A.L. dissolved acetylene cylinder in section, showing how tightly it is rammed with kapok.

when it is exchanged for a new one at a small cost. Naturally, the success of this system depends upon an efficient exchange organisation, and once this is assured more use will be made of it.

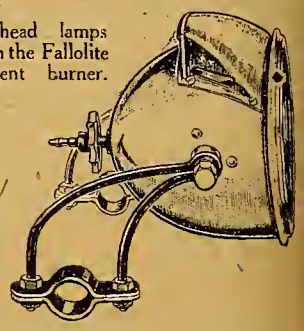
Dissolved acetylene has another advantage in that it allows a still better light to be obtained from a special burner, known as the Fallolite, which will only work with gas under pressure.

Advantages of Dissolved Acetylene.

The Fallolite lamp consists of a tiny burner of the Bunsen type, which is passed through the centre of a Mangin mirror, and its flame impinges on a pastile composed of rare earths, which becomes incandescent in the same manner as an ordinary household gas mantle.

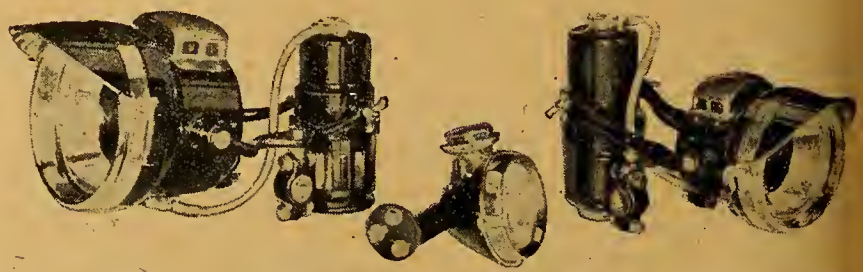
Need for Wide Distributing Service.

Hitherto neither the makers of dissolved acetylene nor the users of motor cycles have yet fully realised its possibilities, and until a few weeks ago no effort had been made to adapt the cylinders to various types of motor bicycles, but this state of affairs is being changed for the better.



A. L. head lamps fitted with the Fallolite incandescent burner.

Allen-Liversidge, Ltd., the producers of D.A. equipment, have now given the system the attention it deserves and are using every endeavour to render it suitable for all types of motor cycles. A new type of motor cycle cylinder is being introduced which is no larger and weighs little more than a motor cycle generator. It is designed to fit a standard lamp bracket. This new cylinder will certainly be a real

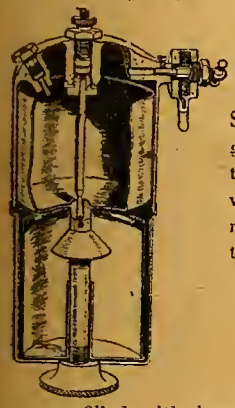


Two types of P. & H. acetylene lamps, of which that on the left is suitable for heavy, and that on the right, for medium and lightweight machines. Between these is the P. & H. sidecar lamp.

Gas Lighting Equipment.—

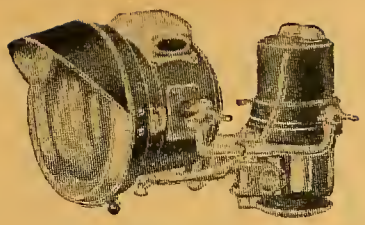
boon to all who have to travel regularly by night, and who do not care to meet the heavy initial expense of an electric lighting outfit.

The cylinders in which dissolved acetylene is sold are of solid drawn steel and are wonderfully light for their size.



Section of the Low generator showing the water valve which is automatically closed as the gas pressure increases.

They are filled with kapok, a vegetable fibre, so tightly rammed in as to be practically solid. A certain quantity of acetone is then poured in and all is ready for charging. The gas, made in huge



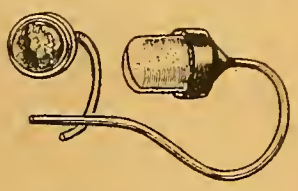
Lucas "King of the Road" acetylene lighting set.

generators, is purified and dried, then pumped into the cylinders, where it is dissolved by the acetone.

A gauge is supplied with the cylinders as an extra, but they are all equipped with a slow opening valve, which allows the flame to be regulated to a nicety. Holding four to five cubic feet of gas the new A.L. cylinder will light head and tail lamp from 7 to 8 hours, while for a sidecar outfit the old six-foot cylinder will still be retained. Special heavy tubing is supplied for dissolved acetylene installations.

Makers of Generator Sets.

Amongst the principal makers of acetylene lighting equipment in which a generator is included are J. Lucas, Ltd., Powell and Hanmer, Ltd., H. Miller and Co., Ltd., and F.R.S. Lamps. These firms produce some extremely efficient and well-made apparatus and in all cases the lamps are suitable for use either with generated



The right hand sketch shows the new Fallolite pastille; that on left has been used for 10,000 miles and is still capable of service.

acetylene gas or with the dissolved variety.

Although rubber tubing is usually used for conveying gas, brass tubing is frequently employed, and on the Low generator and head-lamp set metallic connecting tubes are used throughout. There are a great variety of accessories for use in acetylene lighting, such as dimmers, rubber regulating and distributing bags for use in the supply pipes, and many types of burners.

NEW SPORTING SIDECARS.

Aluminium Zeppelin-shaped Bodies for Lightweights or Heavyweights..

OWNERS of sporting sidecar outfits have long been regarded as a somewhat selfish class, thinking more of the light weight of their sidecars than the comfort of their passengers. But it has frequently been pointed out in these columns that a sidecar body in keeping with the "sporting" character of the machine and its driver need not necessarily be uncomfortable.

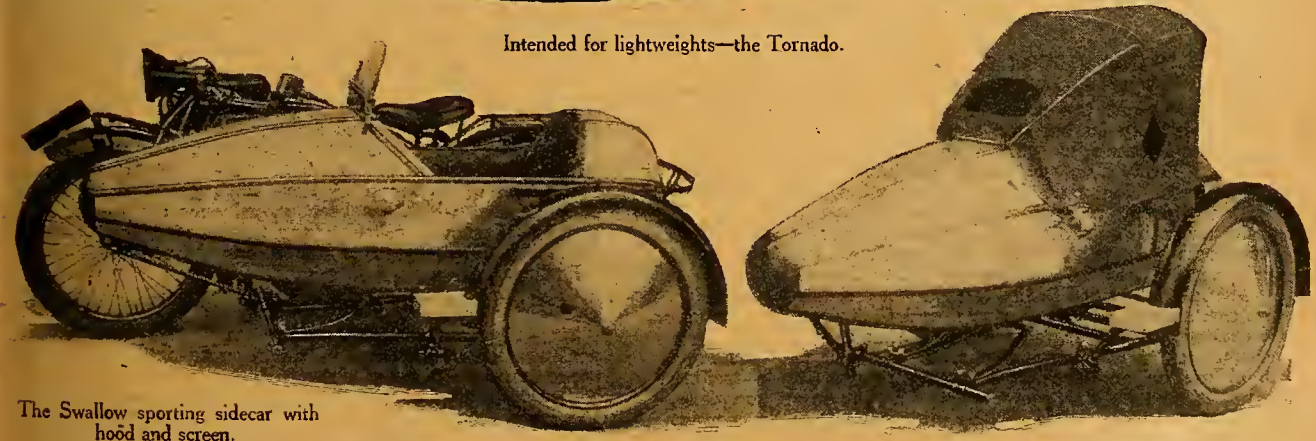
Sidecar manufacturers are beginning to realise this, and at least two comparatively little known sidecars will in 1923 be all that is required by the passengers.

The first of these is the Swallow, which is produced in Blackpool by the Swallow Sidecar Co., Bloomfield Road, and will be at the Olympia Show. From the illustration it will be seen that, while retaining the favoured Zeppelin outlines, the Swallow has the roominess and equipment of the popular touring types.

Constructed of polished aluminium, it permits the seating accommodation to be in the form of a cock-pit, having a high back rest which supports the passenger's shoulders, while a coupé hood is provided for those occasions when the driver be-best of it." This coupé hood is detachable, and is supported on a single stick which normally lies horizontally behind the bulbous back. The chassis is sufficiently strong for use with the largest machines or the popular 500 c.c. types, and the equipment includes a cover-all apron, lamp, polished aluminium disc and step.

Intended for lightweights—the Tornado.

The other sidecar referred to is the Tornado, also a northern production, intended chiefly for such machines as the 349 c.c. A.J.S. It is also of the Zeppelin type. The weight is 65lb., and one of its principal features is the "self-controlled" air cushions used for upholstery. It is manufactured by Hudson and Matthews, of 21, Market Street, Altrincham, Cheshire.



The Swallow sporting sidecar with hood and screen.

The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address.

DOPE AT BROOKLANDS.

Sir,—Three separate references in *The Motor Cycle* on the subject of "dope" struck me as calculated to produce unfavourable impressions among your readers.

Alcohol has, to my knowledge, been used at Brooklands for at least two years, and for longer still by the London General Omnibus Company on the road.

It is possible to buy in London and Liverpool a fuel consisting of 50 per cent. alcohol and 50 per cent. benzol, known as "Discol," which gives excellent results for touring purposes. Though the consumption may not be so good as with petrol, the engine should give more power and run much cooler. Discol is sold at 1s. 4d. per gallon.

So far as racing is concerned, it would be absurd to bar alcohol; let the B.M.C.R.C. rather encourage its use in order that our knowledge of its usefulness and limitations may be augmented.

I beg to contradict the statement that chemical agencies cannot be used for long-distance work and that they are only of use to those to whom even a fifth of a second is important over a kilometre.

I am pained by the apparent ignorance of a well-known manufacturer on the subject of "dope." His remarks are hard to reconcile with either the performance or smell of his machines. Moreover, I do not believe that more than one championship winner at Brooklands could honestly claim to have used less than 20 per cent. alcohol in his fuel. I. P. R.

Reigate.

WIRELESS FOR MOTOR CYCLES.

Sir,—"A.P.'s" comment on the above subject appears to have overlooked the main issue. An ordinary telephone would certainly be best for communication merely between driver and passenger (pillion or sidecar). Communication between them, however, is not absolutely impossible, even at present. The main issue, to my mind, is conversation with the driver of another machine, perhaps as far as five miles away. The modern radio-set, which can be packed into very small compass, makes this possible. Incidentally, it can also be used between passenger and driver.

Though not versed in the technicalities of wireless, I think an earth return is *not* necessary, and that reproduction (concentrated) of the engine-noise has been satisfactorily overcome. Is "A.P." aware that radio has been put to a practical use on aeroplanes? An earth return (say a trailing wire) is possible on a motor cycle, but not on an aeroplane, and an aeroplane makes slightly more noise than the average motor cycle. A.J. 2¼.

London, E.C.4.

H.P. OR FUEL TAX?

Sir,—Surely motorists who are being deluded to support a petrol tax are walking into a trap. I believe the h.p. method is as fair a one as any, but it is too heavy, and should be reduced. The petrol method will mean a heavy burden on the commercial users, and they will certainly press for a rebate. R. COLLYER.

ALT-Y-BADY.

Sir,—I was very much interested in the article "Allt-y-Bady" by "One who Knows the Hill"; but personally I think that the writer gives one the impression that the hill is far worse than is actually the case. I have seen many, many men failing to climb this hill, but I have come to the conclusion that, at least, 90 per cent. of the failures were due to either

(i) Hopelessly bad driving;
(ii) Unsuitable gear ratios; or
(iii) Getting the machine out of control *through taking the hill too fast.* I have seen very few failures indeed ascribable to lack of power or wheel slip. (This, of course, does not apply to sidecar outfits.) In August, 1921, you published a letter from Mr. J. W. Wills in which he proposed having a sweepstake, the winner to be the man who got furthest up the hill on second gear in the Reliance Cup trial of that year. A few days afterwards I attempted to get up on the second gear of 9.5 to 1 of a 500 c.c. single, but failed nine times out of ten owing to the machine getting broadside on to the gradient due to taking the hill at too high a speed; but climbed easily on the bottom gear of 17.5 to 1, which enabled me to take the gradient at a crawling pace. I fail to see any reason why any man should fail to make ninety-nine clean climbs of Allt-y-Bady out of a hundred provided he takes the hill slowly on a low gear ratio.

The same can be said to apply to Wech hill, Harlech (included in the M.C. and A.C. trial of 1920 as "Urry's Pet"), and which has lately been much improved by a layer of hard marl which has been spread over the rough, stony surface. I should consider any club secretary perfectly justified in including this hill in any future trial.

Dudley. J.W.B.

CLASHING OF TRIALS ROUTES.

Sir,—May we suggest that it would be both a convenience and a courtesy if clubs would interchange their programmes with other clubs within a radius of 40 miles? This would prevent two or more clubs running trials over the same course with the same dye and direction signs at the same time. AFFILIATED A.C.U. CLUB

Matlock.

CASTOR OIL IN ENGINE LUBRICATION.

Sir,—I was extremely interested in the article you published recently about castor oil as an engine lubricant. Some of the statements made by Mr. Evans are, however, somewhat startling, and one statement is, indeed, utterly false.

He says that oils are chemical combinations of fatty acids and glycerol. I presume he means vegetable and animal oils only, because the bulk of oils used to-day—mineral oils—do not contain either fatty acids or glycerol, but are merely hydrocarbon oils, *i.e.*, they are compounds of carbon and hydrogen only. Moreover, these oils are extremely stable, *i.e.*, they are difficult to break up into other chemical compounds, and because of this fact they have been termed "paraffins" (Parum, little; affinis, affinity)

The fact that castor oil is insoluble in petrol is a most valuable characteristic, and were it not that this oil possesses grave disadvantages it would undoubtedly be one of the best oils for engine lubrication. Unfortunately, however, when it is heated it is not nearly so stable as are the mineral oils, and it is consequently split up with the formation of free fatty acids. These acids, together with those already present in the oil, are detrimental to any engine, as they tend to corrode all metals with which they come in contact. Mr. Evans states that the corrosion is visible with copper, but it is much more easily visible with certain copper alloys, which are used as bearing metals, whilst the corrosion of steel and iron components is also clearly apparent when the steel is examined under a microscope.

Mr. Evans states that corrosion can take place both with used castor oil and mineral oil if free fatty acids be present; but if a pure mineral oil be used, then fatty acids cannot be formed, and so corrosion does not occur.

Mineral oils of suitable viscosity can be obtained for any type of engine. They are quite as good lubricants as is castor oil, whilst they do not form carbon deposit to any greater extent than does castor oil. Moreover, they are cheaper oils, and finally they do not cause corrosion, so it would appear that the one advantage of castor oil—its insolubility in petrol—is considerably overruled by its many disadvantages.

Newcastle-on-Tyne. KEMIST.

[We have submitted "Kemist's" letter to Mr. Evans, who replies as follows:—

The article I wrote was not inteuded to be sensational, but, of course, new facts are always liable to be regarded as startling. No doubt it would have prevented a perquisition for criticism had I commenced the second paragraph with the redundant word "fatty"—redundant because the article deals *almost* exclusively with fatty oils.

If the term "paraffin" be applied without distinction to mineral oils it is incompatible with scientific practice, and should therefore be discouraged.

The production or alleged production of corrosive acids from castor oil was discussed at length by correspondents in the June issues of *The Motor Cycle*. If I judge correctly, the whole suggestion was ridiculed by those competent to judge.

The statement that pure mineral oils cannot give rise to fatty acids is unfortunate, as it indicates that the writer is not familiar with the chemistry of lubrication.

If mineral oils are as good lubricants as is castor oil, why do racing men prefer blends of castor oil?]

MIDLAND RACE TRACKS.

Sir,—Mr. W. H. Wells is quite right. Motor cycle and motor racing ought to be more of a national sport than it is at present, just let a *real* speedway be built at Birmingham, and there would be "football" attendances.

As I am not the fortunate owner of a motor cycle at present, but follow the sport in the pages of *The Motor Cycle*, as do many others. A Midland Brooklands would be a boon and a blessing to more than one born motor cyclist unfortunately born without a motor cycle. S.S. 80.

Birmingham.

[A race track near Birmingham is shortly to be built.—ED.]

SILENT MACHINES OF LONG AGO.

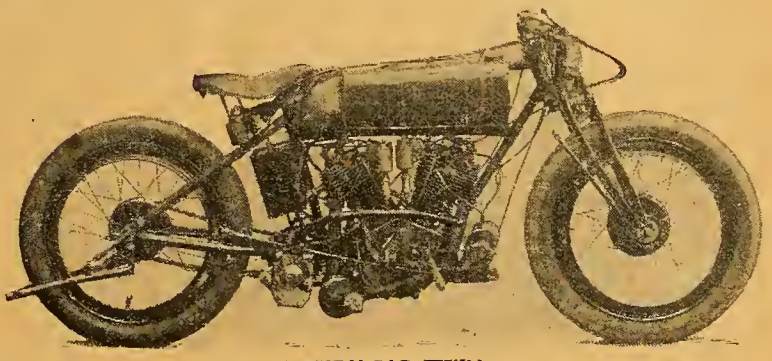
Sir,—I was delighted to see "M.D.'s." letter of Oct. 19th. I quite agree with him on all the points he raises. The modern motor-cycle is without doubt more noisy than its beginning-of-the-century predecessor. I remember that my first machine, a "2 3-16" Beardless-Decision, was absolutely inaudible during most of its time on the road. In fact, any noise that it made was completely drowned by the sound of my footsteps.

Although a gear box was "stuck on," I found that the machine (and I) ran far more easily, and the drive was much more silky, with the gear wheels removed. So much for the advantages of a gear box!

Again, how true is "M.D.'s" accusation of personal uncleanliness. In my young days motor cyclists had some excuse; but with the advent of the modern dustless, mudless, and bumpless road, and the exodus of the necessity for lubrication, this disgusting practice should have ceased. I can only suppose that, in a misguided effort to combat the vicissitudes of the English climate, the culprits deliberately coat their hands and faces with dirt.

In conclusion I must thank "M.D." for confirming my long-held conviction that designers have only discarded the earliest form of silencer to enable themselves to keep their lucrative and easy jobs. A SILENCER.

Croydon.



SPEEDY BIG TWIN.

Another British big twin to do well on the track is the 998 c.c. Rudge, which has set up "triple-eight" record figures. This is the actual machine.

EXTRACTOR ACTION OF LONG EXHAUST PIPE.

Sir,—It appears to me to be quite the wrong idea to put the silencer on the end of a long pipe, as is done in many machines. I think the silencer should be as near to the engine as possible, and I note the A.C.U. judges' comments after the Six Days Trials express the same opinion.

In addition to my own two motor cycles, I have to look after a small four-cylinder light car, which has no silencer at all, but simply a plain pipe running to the rear of the car. Nevertheless, the exhaust is inaudible at slow speeds, and not at all noisy even when all out. When tuning up for slow running the other day, I went to the rear of the car to feel with my hand if the exhaust were regular, and found that every time the engine mis-fired, my hand was sucked violently against the end of the pipe. At first I thought this might be due to a sticking valve, but the valves and springs were found to be all right. It would therefore appear that the rapid flow of the gases, along the straight pipe, even at such low speeds, set up a partial vacuum in the pipe, which, when the engine misfired and produced no exhaust pressure to fill the vacuum, sucked back from the outlet end of the pipe. This suction was strong enough to drag a wooden plug so tightly into the end of the pipe that the exhaust pressure was not strong enough to dislodge it.

I should imagine from this that at high speeds the vacuum set up in the pipe must be very high, and is bound to have a very considerable effect on complete extraction of the exhaust gases. The car is an old Mathis, with valves about as big as a shilling, and it is capable of very high revolutions. It has always been a marvel to me how the gases got away in the short time allowed, but I begin to understand now.

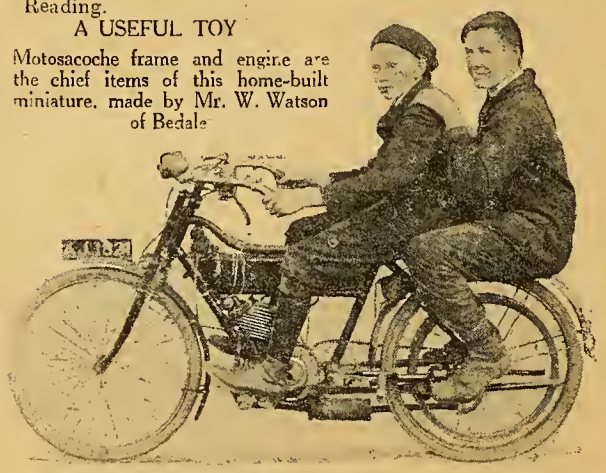
Of course, this is doubtless ancient history to expert speed

men, but the demonstration on this car, at low speeds (about 300 r.p.m., I should think) proves that the principle is of service on touring machines. I should also think that it is quite possible to have too large an exhaust pipe, which would not give sufficient gas velocity to attain this extracting action. ELDON.

Reading.

A USEFUL TOY

Motosacoche frame and engine are the chief items of this home-built miniature, made by Mr. W. Watson of Bedale



HUMIDITY AND POWER OUTPUT.

Sir,—After numerous experiments I succeeded in designing an efficient humidifier, and have been running for four months with this attachment on a 595 c.c. Douglas sidecar. I find it impossible to overheat the engine under any condition. The improvement in hill-climbing ability is exceptional. No difference is noticeable when starting up.

The cylinders show no internal effects of rust, and carbonisation is noticeably decreased. The amount of water that is consumed in 100 miles is approximately 1½ pint. Misfiring does not occur. An Amac carburetter with 24 jet is used, and no alteration to the petrol level has been made, but an extra air attachment, which I had formerly fitted on the induction pipe, has been discarded to give greater efficiency to the air velocity through the humidifier. While not venturing to commit myself by saying that the horse-power is increased, the impossibility of overheating naturally gives the highest efficiency all the time. While I cannot classify myself as a novice in the theoretical working of the internal combustion engine, there is one point which I cannot understand, namely: Why does misfiring not occur in a charge mottled with water spray, no matter how fine? Perhaps some of your scientific readers will give me the solution. EXPERIMENTOR.

London, S.E.15.

Sir,—As a meteorologist, albeit a young one, I feel I must draw attention to the somewhat loose statements made by "J.H.H." and "M.B.B.H." on "Humidity and Power Output."

"M.B.B.H." states that "the atmosphere tends to become humid and so heavier." May I point out that although during the night hours relative humidity of the atmosphere generally continues high (80%-100% varying with locality), this has but the slightest effect on barometric readings. The comparatively enormous difference of pressure occasioned by the passage of an "anticyclone" should therefore endow a baby two-stroke with the "kick" of a Brough Superior. Alas! the age of miracles is past.

"J.H.H." should watch his barometer very closely; he may then observe the not unusual spectacle of rain and a rising barometer occurring simultaneously.

I find that my own old big single evinces a tendency to "super-Rudge" in an alarming fashion when travelling at night through mist-filled valleys. True, the cold air here must be slightly heavier than the warmer air on the hill-tops, but may not the extra "pep" communicated to the engine be due to (a) humidity of the air (witness various patent humidifiers appearing on the market from time to time), and (b) more efficient cooling of the engine?

The theory of heavier air appears feeble, considering the minute differences encountered. P. F. JARROLD.

SOLDERING FOR AMATEURS.

Sir,—I should like to amplify "Road Rider's" paragraph on this subject, as I feel that he leaves too much to be taken for granted. First I would say to the amateur do not hold a union in a vice. Ten to one it will be squeezed out of shape or marked so that it will leak.

My method is as follows:—

(1) Clean the pipe end and the inside of the union till shiny copper or brass is showing.

(2) "Tin" both with solder. Coat with flux, then apply the hot iron with solder to the pipe all round for ¾in. from the end. Tin the union by coating the interior with flux, put a small piece of solder inside and heat over the domestic gas ring in the absence of a blow-lamp. Rub the solder round with a wooden match stalk dipped in flux until there is a coating everywhere inside. Hold the union by its shank with an old pair of cone pliers.

(3) Slip the union nut on the pipe and tie it up out of the way if possible.

(4) Coat both pipe and union with flux; heat up, and resting the union on something solid, press the pipe home. Blow through the pipe to ensure a clear passage.

(5) Remove the heat and allow solder to set. Examine again for a clear passage, and touch up junction of union and pipe with soldering iron if necessary to make a neat joint. J. STUART WHITE.

EYE PROTECTION FOR THE SPECTACLED RIDER.

Sir,—I would like to thank those who have replied to my letter. I very much appreciate the suggestions and advice they have put forward, but, with the exception of the smashing of the old goggles I have not acted on any of them.

I have instead purchased a Pidko cap. Heading off with the usual disclaimer, I may say that this most excellent piece of headgear has positively surprised me with its efficiency as a windscreen. As comfortable as an ordinary cap and in appearance the same, the screen being almost invisible to the casual observer, this goggle substitute enables me to speed forth on the windiest day without the smallest discomfort to the eyes, and, what is further ("Ixion's" please note), the screen does *not* make the countryside appear as though it had jaundice, and vision is unhindered.

I do not, however, recommend it for night riding, as the vision is decidedly obscured in this case. Why this should be I do not pretend to say, but it is so.

Bideford. AWAHAWAHAWOO.

SUMMARY OF CORRESPONDENCE.

We thank the many correspondents who have definitely proved for "Ixion's" benefit that the upper spokes of a travelling wheel move faster than the lower ones, but regret that no one has suggested a satisfactory answer to his further silly-season query: What would Queen Elizabeth have done with or to Lloyd George?

THE MOTOR CYCLE

SPECIAL SHOW NUMBERS.

NOVEMBER 25th to DECEMBER 2nd marks the period when the

MOTOR CYCLE EXHIBITION

at Olympia will be open to the public.

In connection with the Show "The Motor Cycle" will publish three more special issues as under:

Nov. 16th. Passenger Machines.
Nov. 23rd. Show Forecast and Guide.
Nov. 30th. Show Report.

Each of these enlarged issues will embody special features possessing a strong appeal to all who own or who contemplate the purchase of a motor cycle.

To avoid disappointment an order should be placed in advance with the local Newsagent.

EVERY THURSDAY....THREEPENCE.

Prepare for Fog.

The season of fogs is upon us. An ordinary headlamp is practically useless in a fog, but if a piece of yellow material capable of being slipped over the front glass of the lamp be carried on the machine, night driving in foggy weather can be made much easier.

New Use for Official Boots.

An exhaust pipe kicking campaign is the latest form of police activity to be practised. Edmonton is the danger area, and motor cyclists, passing through, are advised to be sure that there is no slackness in their silencer joints, etc.

To Amuse the Baby.

For several miles last week-end we travelled in the wake of a family sidecar the driver of which continually bounced in his saddle, although the road was in good condition. The only explanation is that he was performing to amuse the baby.

D.R.'s Reunion in Leeds.

It is proposed to hold the fourth annual re-union dinner of 31st Divisional D.R.'s in Leeds on November 17th. All communications should be addressed to Mr. J. A. Tetlow, 53, Markham Avenue, Harehills, Leeds. As previously all expenses will be pooled.

More Horse Accidents.

According to statistics carefully tabulated by the Automobile Club de l'Ouest on road traffic during the months of July, August, and September, 1922, in the department of La Sarthe (W. France), there were 54 horse accidents, against 28 car and 36 bicycle road mishaps.

Preparations, Compounds and Solutions.

The modern motor cyclist's garage is rapidly becoming like a beauty parlour with the varied assortment of pastes and creams in tins, jars, and tubes now marketed for jointing flanges, smearing bolt threads, stopping leaks, cleaning aluminium, making belts grip, getting tar and stains off, cleaning the hands (dry), cleaning the hands (wet), gingering up the petrol, oiling up the petrol, filling the inner tubes, keeping wet off windscreens, polishing enamel, preserving hoods, etc.

Now We Know!

"Cut-out:—A ballyhoo for tin horn drivers.

"Flywheel:—A round piece of metal that goes around and around, but never gets anywhere. There are no flies on it, contrary to expectation.

"Magneto:—A peculiar shaped box filled with broken bits of lightning.

"Miles-per-gallon:—An exaggeration.

"Miles-per-hour:—See above.

"Tail light:—An electrical device with whims."—Extracts from an amusing dictionary of motor cycle terms in an American trade paper.

Club News

Bradford M.C. and L.C.C.

Rain caused the curtailment of the solo classes in the club's handicap speed trials held on the 22nd ult., and the sidecar results only are available:—

1. R. T. Cawthorne (490 Norton sc.), handicap 70 m.p.h., actual 75 m.p.h., Silver Cup.
2. E. P. Dodd (492 Sunbeam sc.), handicap 58 m.p.h., actual 60.2 m.p.h., Silver Medal.
3. E. Flintoff (492 Sunbeam sc.), handicap 57 m.p.h., actual 58.63 m.p.h., Bronze Medal.

Fastest time in sidecar class:—R. T. Cawthorne (490 Norton sc.), Silver Cup.

Reigate, Redhill and District M.C.C.

Results of the night trial, held on the 21st ult., are as follows:—

GOLD MEDAL.—R. Alderton (Albert car).

BRONZE MEDALS.—E. C. Gordon (499 Triumph), V. F. Long (976 Excelsior sc.), A. B. Lavy (499 Sunbeam).

The annual dinner will be held at Laker's Hotel on December 13th. Further particulars are obtainable from the hon. secretary, E. L. Bewers.

S.E. Centre and A.C.U.

Through a misunderstanding, official results of the Open Trial held on July 8th last are only now to hand. The awards have been made as follows:—

GOLD MEDALS.—H. Jepson (976 Zenith sc.), Hardy Mason (Amilcar).

SILVER MEDALS.—T. G. Meeten (598 Indian), E. C. Gordon (499 Triumph), P. L. Mayo (293 Coventry-Eagle), P. Cunningham (555 P. and M.), F. A. McNab (650 Trump).

BRONZE MEDALS.—A. R. Wood (596 Indian), W. Bucknell (976 Matchless sc.), T. G. Ross (976 Matchless sc.).

SPECIAL BRONZE.—Mrs. G. M. Janson (211 Levis), E. F. Chidley (555 P. and M.), A. H. Cox (499 Triumph).

No team finished complete, but a special award for meritorious performance was made to the P. and M. team.

Sutton Coldfield and North Birmingham A.C.

Official results of the Autumn Trial, held on the 14th ult., are as follows:—

SOLO MOTOR CYCLES.

SUTTON CUP AND GOLD MEDAL, for Best Performance.—B. Kershaw (249 New Imperial), 64.5 fig. of merit.

GOLD MEDALS.—P. Mosedale (349 A.J.S.), 65.8 fig. of merit; A. R. Edwards (247 Levis), 72.2; D. B. Calder (249 New Imperial), 72.6; A. W. Thrush (492 Sunbeam), 73.8; Stretton Ward (499 Triumph), 78.7; E. R. Jacobs (499 Beardmore-Precision), 81.2; F. H. Jones (247 Levis), 89.5; C. F. Holyoak (249 Federation), 105.2; R. C. Bennett (249 Federation), 110.0.

SILVER (GILT CENTRE) MEDALS.—J. G. Orford (349 Henley), 151.7 fig. of merit; H. V. Collins (733 Brough Superior), 159.0; P. Platts (688 Coventry-Victor), 161.1; J. L. Handley (348 Ivy), 201.7; T. H. Richards (986 Brough Superior), 215.5.

SILVER MEDALS.—L. V. Bowen (247 Radco), 1 mark lost; N. W. Busby (494 Douglas), 1 mark lost; E. E. Radnall (247 Radco), 3 marks lost; B. H. Cunningworth (211 Levis), 10 marks lost; C. W. Anderson (247 Sun-Vitesse), 13 marks lost.

BRONZE MEDAL.—T. M. Eastwood (349 A.J.S.), 21 marks lost.

SIDECARS AND THREE-WHEELED CYCLE CARS.

HOOPER ROSE BOWL AND GOLD MEDAL, for Best Performance.—R. G. G. Beesley (599 Sunbeam sc.), 85.6 fig. of merit.

GOLD MEDALS.—F. A. Watson (599 Sunbeam sc.), 86.0 fig. of merit; H. F. S. Morgan (978 Morgan), 87.2; F. W. Giles (799 A.J.S. sc.), 91.4; G. H. Goodall (1,093 Morgan), 101.0; E. Arthur (733 Brough Superior sc.), 108.0; F. S. Spouse (980 T.B.), 117.0; F. H. Brown (539 Rex-Acme sc.), 121.3; J. Adamson (980 T.B.), 146.0; J. W. Meredith (980 T.B.), 167.6.

SILVER (GILT CENTRE) MEDAL.—J. H. Pedley (1,097 T.B.), 174.7 fig. of merit.

It is hoped that members will make an effort to be present at the annual dinner, which has been provisionally fixed for Friday, December 15th, when all trophies and medals will be presented.

Colchester and District M.C.

Results of the one-day trial for the Worthington Evans Challenge Cup are now to hand, and are as follows:—Winner, E. C. Rose (500 N.U.T.); 2, R. W. Tracey (225 Royal Enfield); 3, C. Broomah (596 Indian).

West Birmingham M.C.C.

At a general meeting held on the 20th ult., a resumé of the past season's events and a winter programme formed the agenda. A satisfactory treasurer's report was also received, and it was announced that a handsome challenge cup had been presented for a winter trial by Mr. H. Turner, a club member.

Plymouth M.C.C.

At the final general meeting of members of the Plymouth and District Motor Cycle and Light Car Club on Thursday (October 12th) considerable discussion took place concerning the question of whether the club was wanted or not, reference being made to the lack of interest shown by riders in some of the events held during the season.

It was pointed out that the weather had been all against riding, and eventually it was decided to carry on the club.

A number of officers were elected and the cups and medals won during the season were presented to the winners by Mr. Baker.

Mansfield and District M.C. and L.C.C.

Winnats Pass proved to be a stumbling-block for many competitors in a trial for the Captain's Cup, held over an 88-mile course in Derbyshire on the 22nd ult. In the afternoon section only seven solo riders surmounted the hill with clean sheets. Seventeen of the 25 competitors checked in at the finish. Results:—

CAPTAIN'S CUP.—V. Hancock (492 Snubeam).

MEDALS.—C. Spearing (349 A.J.S.), E. Blythe (532 Scott), W. Pike (211 New Hudson).

BEST PASSENGER PERFORMANCE.—H. L. Stevens (770 B.S.A.).

BEST PERFORMANCE BY WORKSOP CLUB MEMBER.—G. Parker (596 Indian).

Luton and South Beds. A.C.

Results of the hill-climb held on the 14th ult. are now to hand, and are as follows:—

TIME.

275 c.c.—R. Dickinson (225 Royal Enfield).
350 c.c.—G. L. Werts (350 Curtis-B. and S.).
550 c.c.—C. Dunham (490 Norton).
750 c.c.—C. Dunham (490 Norton).
UNLIMITED.—C. Dunham (490 Norton).
550 c.c. SIDECARS.—K. Driscoll (490 Norton sc.).
750 c.c. SIDECARS.—R. Driscoll (490 Norton sc.).
UNLIMITED SIDECARS.—E. C. Baragwanath (Matchless-M.A.G.).
550 c.c., AMATEUR.—R. Driscoll (490 Norton).
UNLIMITED, AMATEUR.—P. Girling (494 Douglas)

FORMULA.

350 c.c.—G. L. Werts (350 Curtis-B. and S.).
550 c.c.—G. L. Werts (350 Curtis-B. and S.).
750 c.c.—A. Borders (490 Norton).
UNLIMITED.—G. L. Werts (350 Curtis-B. and S.).
550 c.c. SIDECARS.—R. Driscoll (490 Norton sc.).
750 c.c. SIDECARS.—L. Hilt (494 Douglas sc.).
550 c.c., AMATEUR.—P. Girling (494 Douglas).

Cumberland County M.C.C.

Results in the recent South of Scotland reliability trial are as follows:

LIGHTWEIGHT.—R. Pape (249 Velocette). C. W. Lowther Cup and gold medal, J. Edmonto (348 Massey-Arran): J. Hanna (349 A.J.S.).

HEAVYWEIGHT.—L. Harrison (492 Sunbeam F. Rollands (550 Triumph); A. D. Reid (555 P. an M.).

SIDECARS.—R. Drinkall (550 Triumph sc.); Shields (976 Sunbeam sc.).

CARS.—J. Bowness (Coventry-Premier), rose bo for best performance in passenger class and silv medal.

NOVICE AWARD.—J. Hanna (349 A.J.S.)

The club's winter series of lectures is now con mencing, to which all interested in motoring a heartily welcome.

Lewis and District M.C.C.

An inter-club sporting trial was held on the 15 ult. over a secret course in Surrey. Competitor started from Godstone and made two non-stop ci cuits of 27 miles each without the aid of speed meters. Four clubs were represented—the Bright and Hove M.C.C., the Eastbourne M.C.C., and t Preston (Brighton) M.C.C., and the Lewes Clu Results:—

LEWES CLUB.

SOLO.—1, R. G. Martin (349 Excelsior); 2, Green (490 Norton); 3, E. G. Brooke (250 Verus).

SIDECAR.—1, A. A. Jempson (998 Blackburn sc.); 2, E. Chandler (490 Norton sc.).

INTER-CLUB.

AWARDS WON BY MEMBERS OF THE BRIGHTON AN HOVE CLUB.—1, H. Hampton (976 Brough-Superi sc.), gold medal; 2, A. H. Cox (499 Triumph), silv medal; 3, L. G. Watts (494 Douglas), bronze medal

Mid-Bucks M.C.C.

Some excellent times were made at speed tria held recently near Chesterton, but the event wa poorly supported. Fastest time of the day was mad by a new member, R. Newitt, riding a 494 c. Douglas, who covered the course at 74 m.p.h. Results on formula were as follows—1, G. H. Steve (490 Norton), silver cup to be held for one year an gold medal; 2, Miss Bates (499 Triumph), silv medal; 3, W. O. Boldock (346 Hobart).

The final event for the Club Trophy was run o on the 21st ult. under extremely unfavourabl weather conditions. The winner's (H. Little's) pe formance is especially commendable in view of th fact that his 211 c.c. Levis was the only bel driven machine in the trial. Results:—

CLUB TROPHY (TO BE HELD FOR ONE YEAR) AN GOLD MEDAL.—H. Little (211 Levis).

SILVER MEDAL.—J. Parrott (998 Harley-Davi son sc.).

BRONZE MEDAL.—H. F. Eborn (496 Martin syde).

The annual dinner and presentation of prizes wi be held at the Bull's Head Hotel on Tuesday, th 14th inst., at 7 p.m. Tickets are obtainable fro the secretary or any member of the committee, an should be purchased not later than the 11th inst.

ITEMS OF EQUIPMENT.

The Fascination of Extras.

No falling off in the motor cyclist's interest in Accessories.

THERE must be something very fascinating to most motor cyclists in buying extra equipment for their machines.

Nowadays the tendency is (or should be) all toward delivering motor cycles absolutely fully equipped and ready for the road. True, a good deal remains to be done in this respect, but the position in the car world, where equipment is much more lavishly and completely distributed with a new purchase, proves that the gadget fiend (what else is he to be called?) refuses to be exterminated by mere thoughtfulness on the part of the manufacturer of his car.

Therefore, much more so will the lure of the accessory continue to appeal to the motor cyclist, who is a far greater enthusiast at heart than the car owner.

A Very Elastic Term.

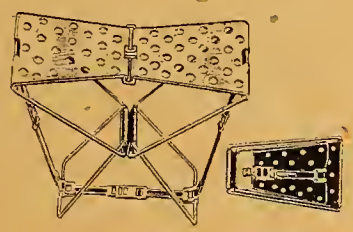
Accessory is a very elastic term. Articles coming under the heading may be broadly divided into two categories: (1) Those that interest the manufacturer, *i.e.*, chains, roller bearings, plugs, etc.; and (2) those that appeal to the private owner, *i.e.*, items which may be fitted to his machine *as extras*, and tools for use on the road or in the garage. It is with the examples of the latter class to be seen at Olympia that this article deals.

In passing, it may be mentioned that, although the Gallery of that building will be a veritable treasure house to the equipment searchers, it will be by no means as representative of the industry as the ground-floor will be of the motor cycles themselves.

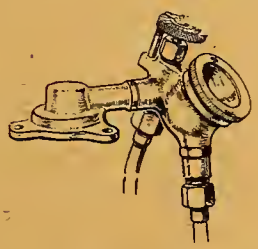
Horns and Hooters.

Since the law requires every motor cycle to be equipped with an audible warning of approach, a horn or hooter should be affixed to every machine before delivery. This is seldom done. Therefore, having placed his order for a 1923 mount, the reader may reasonably be expected to search out the warning signal exhibits. Four types are available—the ever-popular bulb horn of standard dimensions, as exemplified by Clayrite, Dekla, F.R.S., or Lucas products; the mechanically-operated device such as Cowey, Stewart or Pennant; the Clayrite, Dekla, Lucas, or other electric; or the useful and inexpensive "pip-squeak," as shown by several cycle factors.

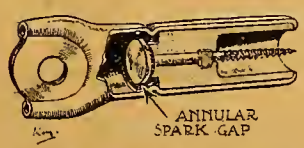
Next to the horn (on the handle-bar anyhow) comes the speedometer, an instrument that all of us want, but comparatvely few of us decide to buy before an unknown early mileage robs much interest from the purchase. Bonniksen (with the new time element), Cowey, Smith (perhaps with a watch case embodied as an integral part, a system which it is claimed "balances" the fitment admirably), Stewart, and Watford are among the well-tried and best-known makes.



Even solo riders might find a use for the very compact Grigg folding seat.

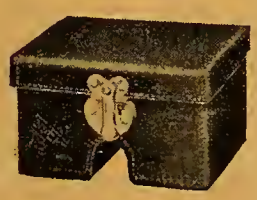


Showell mechanical oiler sight chamber to replace existing drip feed pumps.



Lodge high tension terminal with enclosed spark gap.

Black F.R.S. horn of neat contour.



Tank rail tool bag by Brooks.

Mechanical Lubricators.

It is not such a big jump from speedometers to mechanical oil pumps as one might imagine at first. The pump is an extra that undoubtedly repays its first cost very early in its life; it is also one of the things of which we all tend to delay the purchase until we decide it "isn't worth while now this year." Already proved in the hands of the public are the Best and Lloyd, Lamplugh and Showell fitments, and the name on the new Rotherham grooved spindle tyre pump ensures its efficiency.

Items for Comfort.

Rubber handle-bar grips and knee grips are more and more forming the standard equipment of representative solo machines, but there are still many first-class makes supplied without these fully worth-while extras. John Bull and Pedley are perhaps the best-known names in this connection. An excellent handle-bar muff also bears the first-mentioned *marque*.

Windscreens for solo machines are claiming some attention nowadays, and the latest Easting and T.O.M. products are certain to draw a critical crowd, with sharply divided views on the practicability and usefulness of the scheme.

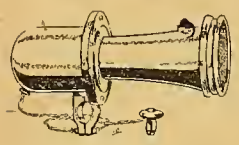
For Pillion Riders.

Pillion riding, too, grows no less popular, and those who indulge in the practice seriously—incidentally, not the people who provide the material for scare headlines in the daily Press—will give careful attention to the relative merits of Saxelby and Tan-Sad seats and the recently introduced XL-All combined pillion seat or spring carrier and ordinary saddle.

Still in the realms of the truly useful, are extra tool-bags and luggage cases. Brooks' range of both, an XL-All combined top rail tool-box and knee grips, and T.O.M. Wearprufe cases with the "Cantslip" fastening straps are among others available.

There will be an infinite variety of tools to fill any additional case. Chain rivet extractors are most important; for

Items of Equipment.—
some obscure reason they are less frequently supplied with a chain-driven machine than the belt punch used to be in the old days or, for that matter, to-day. Of course the chain tool is not required



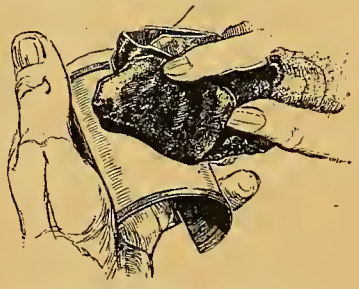
Dekla electric horn.

so often—but when it is needed, it is usually needed badly. The makers of Coventry and Renolds chains both market very serviceable articles; and the Saxessories and Pennant ranges also include neat and well-made devices.

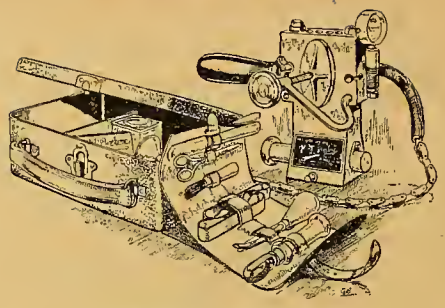
Small Tools.

Spanners should be unnecessary, but a great many motor cyclists make a rule of carrying an additional miniature "adjustable" of the Lucas or King Dick type in the waistcoat pocket.

Anxiliary spark-gaps have been proved to be of considerable use on engines which tend to oil-up sparking plugs. Lodge, Runbaken, and Sparxekas immediately occur in this connection.

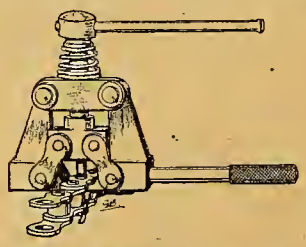


Preparing a Rubbermax patch—a new method of tyre repair



Vulcanising by the owner is facilitated by H.F. Baby outfit.

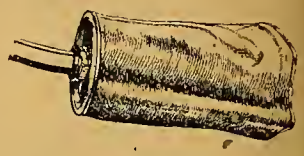
From plugs to valves is a short step. The Flexekas and the F.E.W. air leak preventers are admirable fitments even on a new machine, for prevention is better than cure. Air admitted at the right time and place, however, is beneficial and tends to economy; the Bowden



Rivet extractor made by the manufacturers of the Coventry chain.

extra inlet is an excellent example of a device to do this.

Unclassified and unclassifiable sundries are legion. Specially prepared tyre patches will be shown on the Chemico, Patchquick, Surridge, and Cuthbie (new Rubbermax method) stands, as well as by all the tyre manufacturers themselves. Jacksons of Impervo fame will introduce a new inner tube, sold ready filled with their puncture-sealing compound. Terry's will stage springs and then more springs,

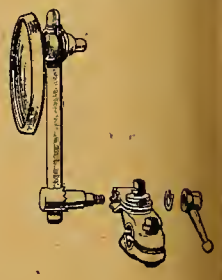


Real weather protectors—John Bull handle-bar muffs.

along with their valve lifter and range of flat spanners. The County Chemical Co., among forty other things, will show a new fuel economiser or "dope," and the Elephant Chemical Co. a new method of packeting carbide refills said to ensure an absence of clogging in the generator. An Enots grease gun system of lubrication specially applicable to motor cycles deserves an enthusiastic welcome.

From Mascots to Bigger Things.

Finally, the big wholesale accessory agents' stands—Brown Bros., Dunhills, the East London Rubber Co., the Manufacturers' Accessories Co., S. Smith and Sons, etc.—will simply be a maze of alluring fitments, from mascots to vulcanising outfits, from handle-bar mirrors to tyre paint.



Clayrite handle-bar mirror showing universal clip.

TO POPULARISE A HILL-CLIMB.

Novel Handicap Method adopted by Bristol Club brings in the Novices.

ONE of the chief troubles of organising club hill-climbs and speed events is to attract the less expert members as competitors; often a long list of classes is but a procession of the same riders on special machines, sometimes with trade backing, if not actually in the pay of one or other of the manufacturers.

In face of this, many ordinary club men, who own standard mounts, play the role of spectators on these occasions, and it was with the idea of persuading them to enter that the Bristol Club experimented with a handicap climb a few weeks ago. The result was so successful that it may pay other clubs to adopt the idea.

Whereas in an ordinary Bristol closed hill-climb an entry of a dozen separate riders is considered satisfactory, in this case there were no less than forty actual competitors, and of these there were only six or seven who could be styled trade men.

First, an ordinary timed climb was run off in the usual classes, and as medals were to be won in this section, naturally all rode to win. Then everyone was given one run on the hill (all in one class) to attempt to beat his previous best time, awards going to those who showed the greatest improvement. A limit of three seconds improvement (the distance was half a mile) was imposed, it being assumed that everyone showing three or more seconds better time had "pulled" his mount in the first section to gain an advantage in the handicap, or for some other reason did not clock a good time. Actually this limit was only exceeded by one rider, and disqualification was well merited, as he was fifteen seconds faster.

The winner of the premier award proved to be an absolute novice riding in his first event, his improvement being $2\frac{1}{5}$ secs.; two other riders tied for second place with $1\frac{3}{5}$ secs. off their previous best, these also being ordinary club men on standard mounts, and it was not until third and fourth places that any of the trade experts came in, with $\frac{4}{5}$ sec. difference.

The chief merit of the scheme is that both classes of rider are satisfied.

168 GNS THE 1923 SCOTT SOCIABLE GNS 168

BRIEF SPECIFICATION:

ENGINE :—5-6 h.p. Scott, rotary valve, two-stroke, twin-cylinder, water cooled.
GEAR :—3-speed, Constant Mesh Dog Clutch System, Novice proof.
CLUTCH :—Combined Cone and Expanding ring within Flywheel.
CARBURETTER :—Zenith.
IGNITION :—B.T.H. Magneto.
TRANSMISSION :—Propeller Shaft to Silent Spiral Bevels.
LIGHTING :—M-L Dynamo.
BRAKES :—Internal Expanding.
STARTING :—By hand lever operated from driver's seat.
SUSPENSION :—Compound system of coiled Tension Springs.
BODY :—Two-Seater with dickey. Coach painted.
WHEELS AND TYRES :—Disc. Detachable and interchangeable all round.
EQUIPMENT :—Hood, Screen, Tools, Lamps, Horn, Pump, Jack, Tyre Levers, Mat, Number Plates, etc., etc.
TAX £4. PETROL :—60-70 m.p.g.
OIL :—2000 m.p.g.

ADVANCE DETAILS OF 1923 MODELS.

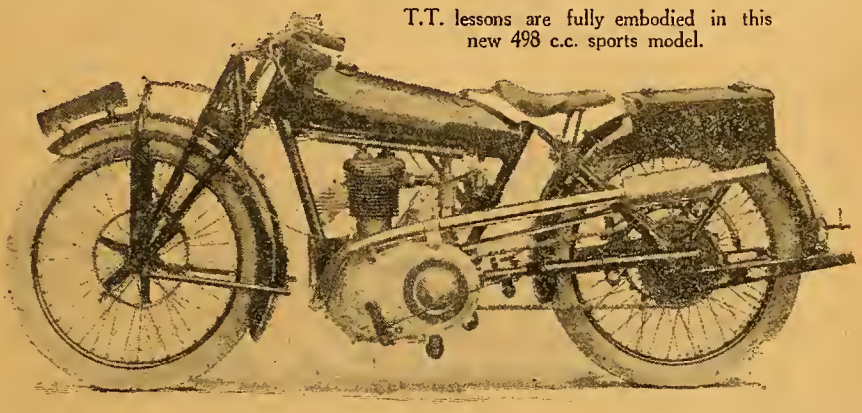
NEW 350 c.c. BEARDMORE-PRECISION.

Four-stroke Singles in Three Popular Sizes. Sporting Model based on T.T. Type.

PRESSED steel construction has been a feature of the Beardmore-Precision machines since 1919, and it is even urther developed for 1923, even the back tays being of steel pressings in the latest nodels.

Of course, the welded steel tank which orms the main frame member is retained. n this tank now are welded lugs for the uspension of the front end of the saddle, hile part of the mudguards form integral embers of the frame.

An addition to the Beardmore range is side-by-side valve outside flywheel achine, having a bore and stroke of 0 × 90 mm. (346 c.c.). This little engine sturdily built throughout, having a carefully designed one-piece cylinder; ample ooling area is provided, and the cylinder held down by a base flange.



T.T. lessons are fully embodied in this new 498 c.c. sports model.

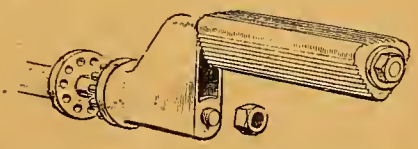
Spring contracted end pieces retain the gudgeon pin—a clever piece of detail design.

Floating in a cast-iron piston suitably lined with bronze bearings is a very large diameter hollow gudgeon pin, and the fixing employed for this part is one of the most ingenious features we have yet encountered. End pieces which pass into the gudgeon pin and lock in suitable recesses in the piston bushes are formed of phosphor bronze and have an internal thread; screwing into these threads is a tightly coiled tension spring. In order to erect the gudgeon pin and the piston, one end piece is screwed tightly on to the spring and the other end piece screwed down as far as possible; the next step is to pass a wire spoke through the first end piece until it presses against the further piece, thus stretching the spring, the further end piece is then fully screwed home and the spring released so that the locking device takes up its position in the slot and firmly holds the gudgeon pin in place.

The H.-section connecting rod has a double row roller bearing, the crankshaft being of the built up type carried in a double row ball bearing on the flywheel side and a single row on the timing side. Both valves are operated by a single cam through a rocker gear. On the outside a cap nut is fitted, which also operates as a flywheel drawer.

The primary chain runs at the outside of the flywheel and it is enclosed in an aluminium pressing, while the rear chain is protected by a light steel guard, a three-speed Sturmey-Archer box with shock absorber in the clutch being employed. The bracket for the gear-operating level is brazed to the frame, thus doing away with unsightly and heavy clip joints.

Behind the engine lies a magneto mounted on a separate aluminium bracket so as to be easily adjustable.

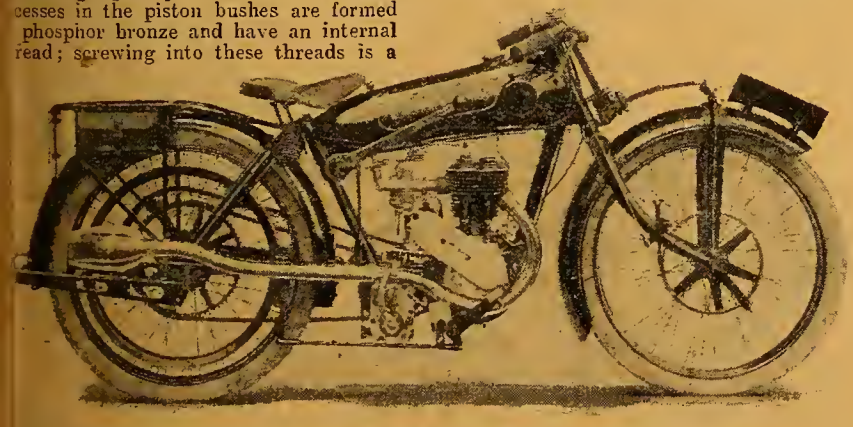


Beside being adjustable, the three-sided pad of the footrest gives it triple lease of life.

A modification of the Beardmore Tourist Trophy fork having a horizontal leaf spring and vertical pressed steel member is fitted. This fork, of course, is pivoted at the crown.

A large diameter band brake is fitted to the front wheel, and an internal V brake is employed with a dummy belt rim on the rear wheel. 26in. × 2¼in. tyres are standardised, the rim and mudguards permitting the use of 2½in. tyres for sidecar work, if so desired.

A simple petrol filter is part of the design, and the wheelbase is only 50in.



Among the many new 350 c.c. four-stroke singles being introduced, the side-valve Beardmore-Precision should fill a worthy place.

Advance Details of 1923 Models.— With the standard compression ratio of 4.25 to 1, the little Beardmore-Precision is a fast and handy mount.

A modification of the T.T. engine has enabled the firm to list a sturdy machine in the 500 c.c. class which is suitable for both solo and sidecar purposes. This engine follows the lines of the well-known 598 c.c. Precision, being formed as a unit with the three-speed gear box. A method of adjusting the front chain has, however, been added. The bore and stroke are 81.1×96 (498 c.c.), and the engine may be obtained with compression ratios of 4½, 5, or 5.7 to 1, according to the uses to which it is to be put.

Detail modifications include a modified cylinder head, a finned exhaust valve cap, a short ribbed aluminium exhaust branch, and a folding kick-starter.

A considerable alteration has taken place in the forks, which are now of the link type instead of being pivoted, though the usual Beardmore type of leaf spring is employed.

The remarkably sensible type of combined tool case and carrier which is a feature of the makers' machines is incorporated at the rear, and the whole of this unit, together with the mudguard, can be detached in the neighbourhood of the back stays to facilitate tyre repairs.

No decompressor it fitted to the 498 c.c. engine, but flexible feed tubes and a very easily detachable filter are refinements of some importance. Two gallons of petrol may be carried in the pressed steel tank, and the saddle peak is attached to the top of this unit. Tyre size is 700×80 mm.

The 598 c.c. big single machine remains largely unaltered, but, as is the case with other Beardmore-Precision models, it is fitted with front hubs of the makers' own manufacture, carrying ⅜in. balls.

The list price of the 346 c.c. machine is £75. £80 is the figure for the 498 c.c. model (£100 with sidecar), while the 598 c.c. sidecar outfit is £110, or £85 in solo form.

FOUR-SPEED 247 c.c. J.E.S.

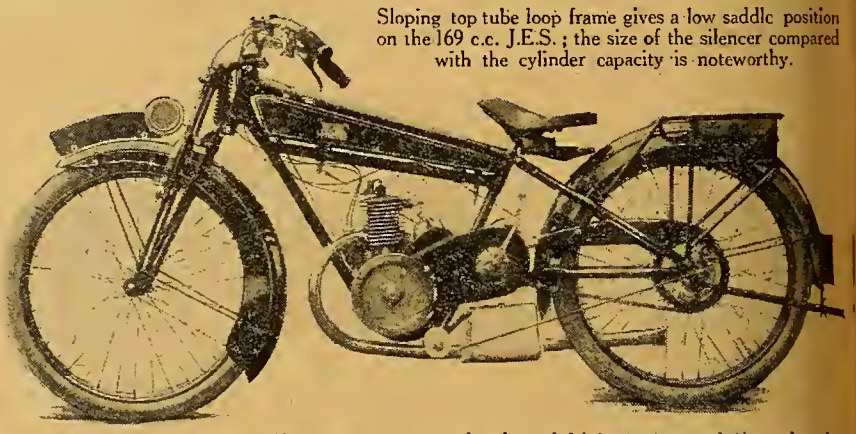
Single-gear Belt-drive and Three-speed Chain-drive 169 c.c. Lightweights and New Larger Model.

FOR many years Mr. J. E. Smith, of Gloucester, ploughed rather a lonely furrow with his excellently designed and constructed miniature engines and motorised bicycles.

His business is now styled the J.E.S. Motor Co. (Gloucester), Ltd., and next year will produce a range of machines extended by a 247 c.c. two-stroke equipped with a four-speed gear.

The engine of this machine is of the three-port type with a roller bearing big end, lubrication being automatic by pressure and suction; the carburetter is an Amac.

Saddle height of 28in. is obtained by a sloping top tube frame and the transmission is by chain throughout, through the J.E.S. four-speed box, which is mounted above the bottom bracket. The gears are of the constant mesh type, changes being effected by a sliding key, on the lines of machine-tool practice. The ratios are 5, 8, 12 and 15 to 1, and there is a shock absorber in the rear hub; the main brake is of the expanding type in the rear hub. The tyres are 26×2¼in.



Sloping top tube loop frame gives a low saddle position on the 169 c.c. J.E.S.; the size of the silencer compared with the cylinder capacity is noteworthy.

The 169 c.c. models have two-stroke engines of the type which distinguished itself in the A.C.U. Six Days Trials, but one has a three-speed gear box with clutch and kick-starter and the other has direct belt drive.

J.E.S. machines are priced as follows: 169 c.c. single-speed, £30 9s.; 169 c.c. three-speed, all-chain, £47 5s.; and 247 c.c four-speed, all-chain, £59 17s.

MODERATELY PRICED BIG TWINS.

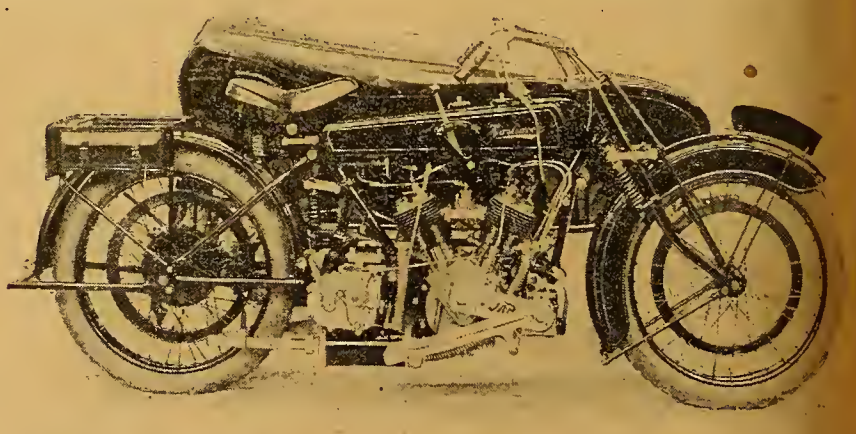
Hazlewood Sidecar Outfits and Solo Machines for 1923. J.A.P. Engines throughout.

LOW-PRICED big twin sidecar outfits are the most important items on the Hazlewood programme for 1923.

With a 976 c.c. J.A.P. engine and Hazlewood gear box and final belt drive one model with a commodious and well-made sidecar is priced at £115. The same outfit with a 770 c.c. J.A.P. engine costs £5 less; 650 × 65 mm. tyres are fitted in both cases.

A more elaborate outfit with 750 × 80 mm. tyres and internal expanding brakes, front and rear, is priced at £118 (with the 770 c.c. engine). A hand-controlled clutch is fitted in this case, instead of the foot type of the two first-mentioned models.

Right at the top of the scale is a 976 c.c. J.A.P. engined outfit, to a *de luxe* specification, and with final chain drive, at £126, and in between are 770 c.c. sports and tradesman's carrier outfits, both at £112. Hazlewood spring seat

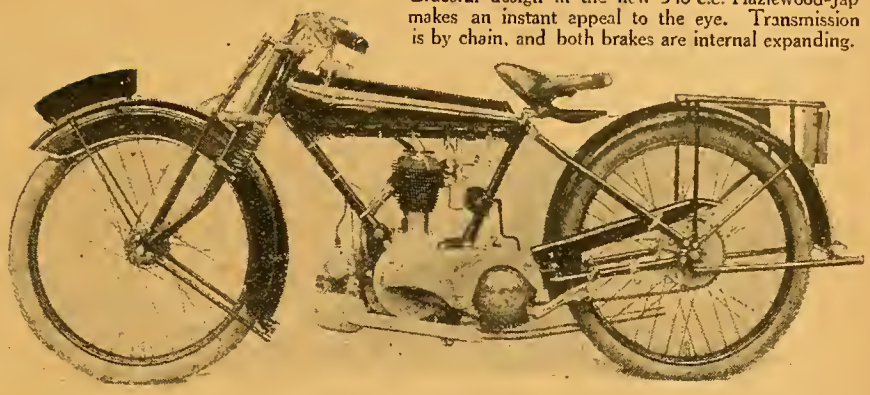


With chain and belt drive the complete Hazlewood sidecar outfit is to be sold at £110 or £115 according to the choice of the 770 c.c. or 976 c.c. J.A.P. engine.

Advance Details of 1923 Models.—

pillars are fitted in every case. 350 c.c. and 292 c.c. J.A.P. engined solo machines complete the list. The most costly of these, with the larger engine, a three-speed Sturmey gear box and internal expanding brakes front and rear, is only £75; and final chain and belt-driven models with the 292 c.c. engine and a similar two-speed box are £70 and £65 respectively.

Considering that Hazlewood lightweights belong to the large class of machines using proprietary components for engine and gear box, they are unusually distinctive in general outline. The riding position in every case is good, and the rider's comfort has been studied in the provision of footboards and an XL-All saddle.



Graceful design in the new 348 c.c. Hazlewood-Jap makes an instant appeal to the eye. Transmission is by chain, and both brakes are internal expanding.

MEETING EXTREME REQUIREMENTS.

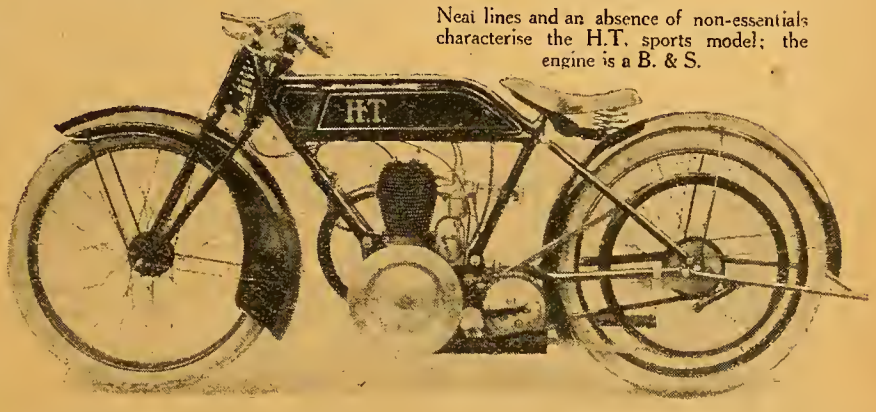
Sports Solo Model Introduced by Makers of the Hagg Tandem.

ALTHOUGH decidedly unconventional, the machine introduced as the Hagg Tandem, and now known as the H.T., bore every mark of careful designing, with the object of providing a machine having enclosed mechanism and full protection from road dirt. Incidentally, the machine was planned to carry two people, as its name implies.

Now the H.T. Motor Cycle Co. has gone to the length of catering for taste at the other end of the scale, and produced a straightforward sports model, neat almost to the point of bareness.

Sleeve Valve Sports Model.

The frame of the H.T. sports machine is of the usual type, with curved top tube; the power unit is a 349 c.c. B. & S. sleeve valve engine and transmission is by chain and belt through a Burman two-speed box. Webb expanding brakes are fitted to both wheels, and Maplestone front forks are used.



Neat lines and an absence of non-essentials characterise the H.T. sports model; the engine is a B. & S.

Almost unique in being designed as a tandem two-seater on two wheels, and at the same time following the general lines of a motor-bicycle, the H.T. dual-purpose machine has many commendable features. The frame is simple and strong, and the rear wheel is adaquately sprung.

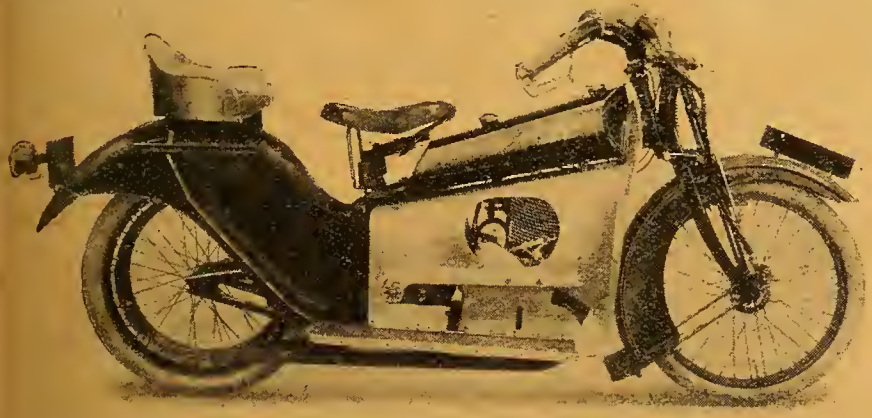
Again a B. & S. engine is employed, and belt and chain drive is used, the Burman gear box being foot operated. Webb brakes are carried by both hubs, and the tyres are 26 × 2½in.

Hand Starting.

Starting is effected by a long hand lever on the off-side of the engine cover or "bonnet."

Provision is made for rapidly detaching the passenger seat, and it is noteworthy that the bulk of the weight is within the wheelbase; moreover, both seats are only 29in. from the ground.

The footboards are sufficiently long and the extra seat sufficiently far forward to allow adequate support for the passenger's feet; it will thus be seen that the usual objections to pillion riding on the score of instability, and over-hang of the additional rider are eliminated in the H.T. design.



One of the few single track machines built for two people—the spring-frame H.T., formerly known as the Hagg tandem.

TWO MORE ULTRA LIGHTWEIGHTS.

THERE will be several new names on machines exhibited at Olympia.

Among these will be the Ray, an ultra-lightweight, produced in Nottingham by W. H. Raven and Co., Ltd.

This machine will have a 200 c.c. four-stroke engine, a two-speed gear and clutch in one unit, and a single driving chain.

Another new lightweight for next year is the D.O.M., produced in Loughborough; it will have a 147 c.c. Villiers engine and clutch, 26 × 2¼in. tyres, Brampton forks, and a Carbjector silencer. While the price has not yet been fixed, we understand that it will be well under the £30 mark.

TRIUMPH REFINEMENTS FOR 1923.

Detail Changes on Four-valve Model; New Forks and 3 in. Tyres on Chain-driven 550 c.c. Machine; Larger Engine, Clutch and Kick-starter on Two-stroke. Attractive Sporting Sidecars.

ALTHOUGH the improvements to the Triumph range of models for 1923 may seem, when viewed separately, of a minor nature, taken together they undoubtedly enhance the great reputation of the firm and the usefulness of the machines.

The chief innovations are a larger engine and a clutch and kick-starter for the two-stroke lightweight, and a "super-sporting" sidecar for the four-valve, 499 c.c. machine. Detail alterations have also been made to the last-mentioned model and to the 550 c.c. chain-driven side-valve single. Electric lighting, by Lucas Magdyno, has been arranged for as a "standard extra" in every case except the lightweight.

T.T. Lessons on o.h.v. Model.

Since it is newest, we will deal with the four-valve machine first. Following the lead of the T.T. Triumphs this year, the sparking plug has been transferred from the centre of the cylinder head to an accessible position at the side. The silencer has been considerably enlarged and the initial pair of exhaust pipes take an easier sweep than hitherto. Instead of two tail pipes to the rear, a larger single pipe is fitted at the right-hand side, which permits the foot-rest hanger bars to be modified to give a greater ground clearance. From actual road experience we know that these changes will remove two of the few points for criticism on this most fascinating machine.

700 × 80 mm. instead of 26 × 2½in. tyres and new Druid-type Triumph forks will be fitted to the chain-driven machine next year, as well as a new and more efficient front mudguard and front wheel stand.

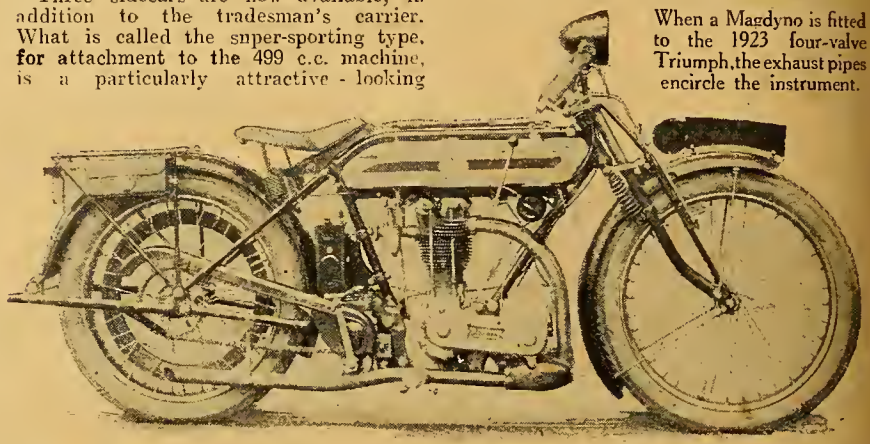
No alteration of importance has been made to the chain-cum-belt Sturmey gear machine, which retains the old barrel-spring "hinged" fork.

Electric Equipment as Standard Extra.

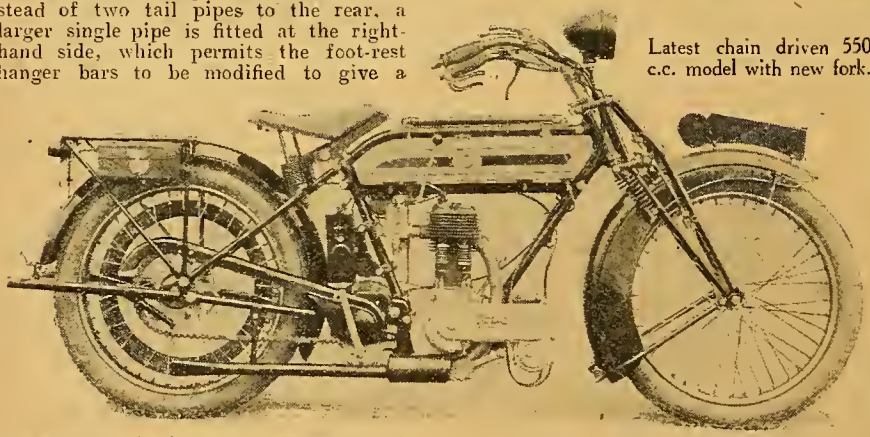
As already mentioned, special provision has been made for Magdyno equipment on the three larger machines. On the four-valve model this entails a special bracket and a lengthened and slightly dropped magneto driving chain. In each case a special head lamp is used, supported on a central single pillar with a large eccentrically faced washer to permit the lamp to be tilted to the correct angle. A new bracket has also been devised for carrying the battery case on the saddle tube.

Three sidecars are now available, in addition to the tradesman's carrier. What is called the super-sporting type, for attachment to the 499 c.c. machine, is a particularly attractive-looking design. The standard chassis is used, but a polished aluminium body is supported on coil instead of leaf springs, as on the latest touring attachment. Roomy but exceedingly sporting lines are followed by the body, which has a combined windscreen and apron of ingenious design. The screen slides forward to allow entrance or exit for the passenger and, being hinged, may be dropped completely when the car is empty. A second apron then extends from the dash to the back of the seat. Access to a capacious locker is gained by removing the back cushion, and on the top of the locker is a platform big enough to carry a spare tin of fuel. The weight of the complete sidecar is 132 lb., against 169 lb. for the coachbuilt touring model.

In between these two comes a coachbuilt sports sidecar of simple but sturdy design, not unlike the aluminium one in general contour, but without its refinements of windscreen, etc.



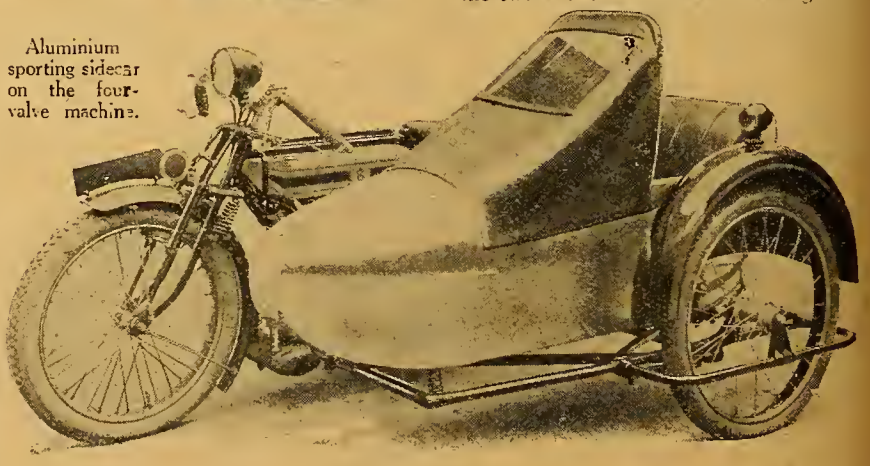
When a Magdyno is fitted to the 1923 four-valve Triumph, the exhaust pipes encircle the instrument.



Latest chain driven 550 c.c. model with new fork.

Increased Engine Size of Two-stroke.

Perhaps the most improved of all is the two-stroke miniature. The engine is



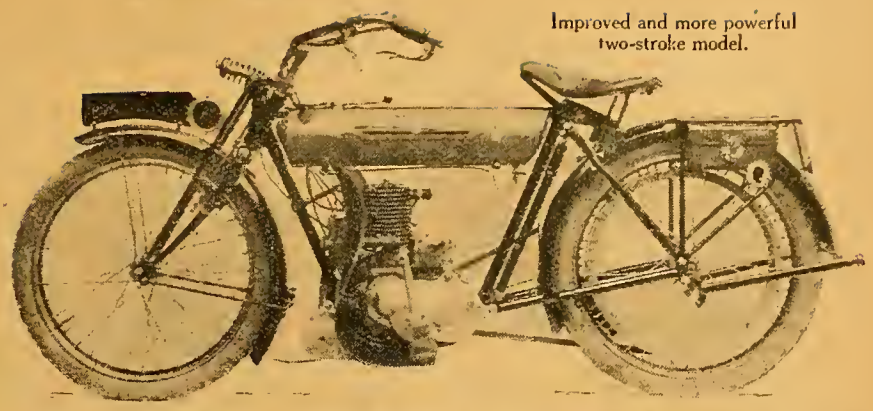
Aluminium sporting sidecar on the four-valve machine.

Advance Details of 1923 Models.—

now 67.25 × 70 mm. (249 c.c.), and has been re-designed so that the inlet port is at the side of the cylinder instead of in front. A large aluminium silencer, with an exit tapering to a wide slit, makes for considerably greater silence.

Carried in a bush in the primary chain cover, the new kick-starter operates directly on a pinion alongside the engine sprocket, the pinion, of course, being provided with a ratchet and spring engagement. On the tiny two-speed gear box there is now an equally tiny clutch, of the fabric insert type, but in general arrangement and face-cam actuation following that on the Triumph three-speed box. It is handle-bar controlled, but the change-speed lever is now mounted on a boss on the front tank strap. This gives an improved indication of the neutral position of the lever—*i.e.*, when it is parallel with the top tube.

Polished aluminium legshields of graceful contour, and wider front and rear mudguards, complete the transformation of this popular miniature.



Improved and more powerful two-stroke model.

ADDITIONAL NEW IMPERIAL MODEL.

348 c.c. Touring Double-purpose Machine. Few Changes to the other Lightweights.

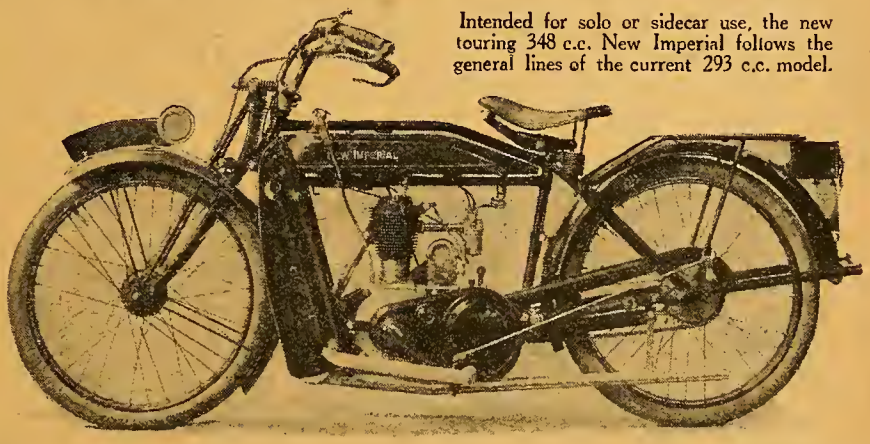
CONSIDERING the numerous successes of New Imperial lightweights this year in competition on road and track, it is not surprising that practically no changes have been found necessary for 1923.

On the 293 c.c. Light Tourist model a larger silencer has been fitted, but since the exhaust pipe curves have been improved an actual gain in power should accompany the greater silence thus obtained. Positive adjustment for the primary chain, by means of a draw-bolt, is the second and last innovation in this case.

Two Sports Models.

The 248 c.c. and 348 c.c. sports models also have been fitted with this means of facilitating chain adjustment, and again the question of silence has received attention. In the straight through fish-tailed exhaust pipe, a neat silencer is introduced in the neighbourhood of the chain stays. Also a rear carrier is supplied, fixed independently of the rear mudguard to allow easy removal for participation in speed events.

These three machines comprised the complete New Imperial range of lightweights during 1922, but for next year an addition has been made in the shape of a 348 c.c. touring machine for solo or sidecar use.



Intended for solo or sidecar use, the new touring 348 c.c. New Imperial follows the general lines of the current 293 c.c. model.

In general specification it follows the same lines as the others, a loop frame, carrying engine and New Imperial three-speed gear box, internal expanding brakes front and rear, shock absorber on engine shaft, etc., being salient features. The engine, however, is of the touring type, and the gear box has a kick-starter and a wider range of ratios than the sports type.

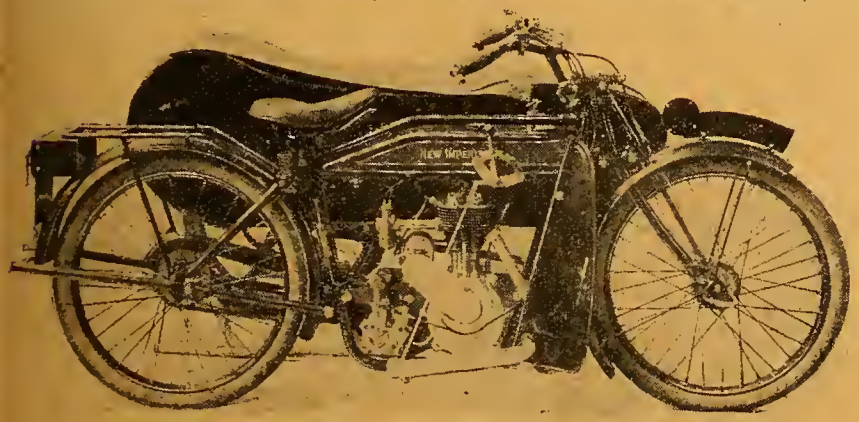
Touring handle-bars, footboards, wide mudguards, neat leg-shields, and other details as on the Light Tourist also distinguish it from the sports machine.

A special sidecar has been designed which is remarkable for its roominess and comfort compared with the average attachment hauled by 350 c.c. engines. It has a large door, and even an aluminium step.

The chassis is of simple triangular construction, having three point connections. "cantilever C" springs—a coined term that aptly describes the system—in the rear, and a single C spring in front, carry the body.

Finished in New Imperial green the outfit is most attractive in appearance.

Several changes are also being made to the 976 c.c. twin, including a new loop frame similar to the lightweights, and the most efficient looking internal expanding brakes we have yet seen on a motor cycle. More details will be published next week.



The 348 c.c. New Imperial outfit is as fully equipped as any of the 500 c.c. type.

250 c.c. ARIEL LIGHTWEIGHT.

Addition to a Wide Range, as well as Chain-driven 498 c.c. Machines.

TWO important additions have been made to the Ariel range for 1923—a 249 c.c. lightweight and a chain-driven 498 c.c. model (sports or touring).

Although the engine of the former is a Blackburne, it has been specially designed in some respects, including a magneto platform at the rear. Since the frame is of the loop type, this gives a very neat and well-balanced layout.

The riding position is low and comfortable, half-flat handle-bars helping towards this last-mentioned attribute.

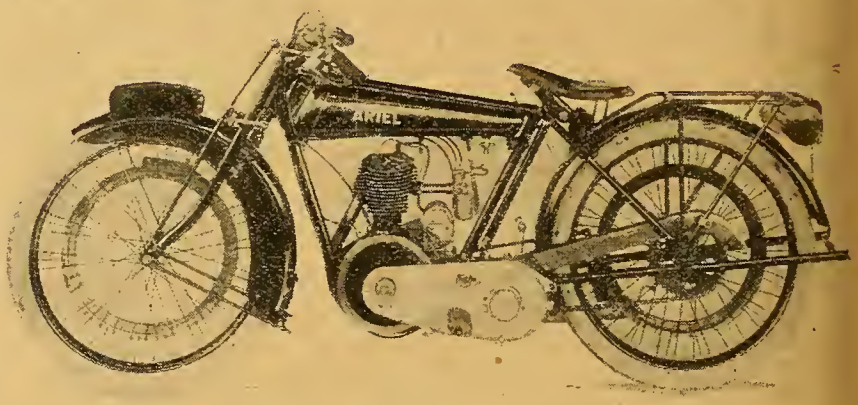
All-Chain Transmission.

Transmission is by chain throughout, by way of a lightweight Burman two-speed gear box, with clutch, kick-starter, and transmission shock absorber. The primary chain is covered in and the rear one guarded on its upper run.

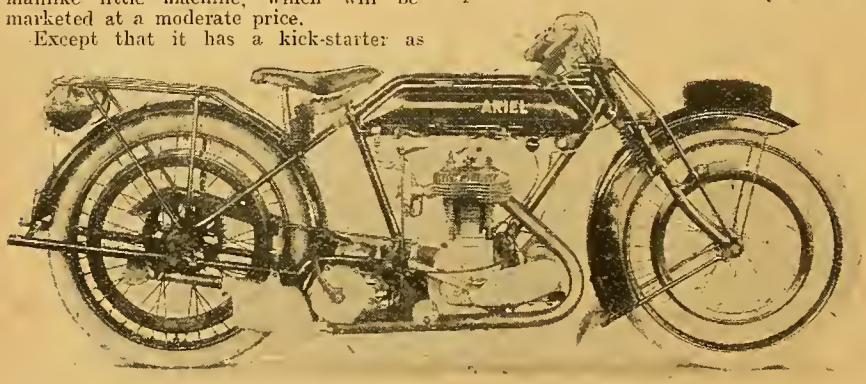
A neat but effective detachable aluminium silencer is fitted below the right rear chain stay.

B. and B. carburetter, E.I.C. magneto, front wheel stand, and Druid forks complete the specification of this very workmanlike little machine, which will be marketed at a moderate price.

Except that it has a kick-starter as standard, the belt-driven 498 c.c. sports model is unchanged. Several new features, however, appear on a chain-driven version of the same machine. Deeper radiating fins and a simpler decompressor operation—both tested in this year's Six Days Trials—are the chief improvements. A roller bearing big end, ball bearings at the driving side of the main shaft, and a larger exhaust pipe emptying into a new type silencer, like the lightweight at the rear, are the other changes. There is a transmission shock absorber on the main shaft.



Embodying a loop frame, the lightweight has a very compact appearance.



Chain transmission is offered as an alternative to final belt drive on the 1923 498 c.c. sports model.

Touring and Sidecar Models.

Most of these alterations also apply to the 498 c.c. touring model, which differs in having two leather tool-bags, an Ariel spring seat pillar, wider mudguards, and footboards instead of footrests.

All the models dealt with thus far, including the lightweight, have efficient dummy belt rim brakes front and rear.

The 796 c.c. twin (chain- or belt-driven), 665 c.c. single (chain-driven), and 993 c.c. M.A.G. twin (chain-driven), remain practically unaltered.

Thus the 1923 Ariel range caters for every type of motor cyclist, and the prices, moderate in themselves, will be doubly attractive by reason of the firm's reputation for workmanlike and reliable products.

FOUR-STROKE IVY FOR NEXT YEAR.

Well-known Two-stroke Specialists Introduce a 350 c.c. Four-stroke.

INTEREST is automatically aroused by the news of a four-stroke machine with Ivy on its tank, and it becomes more acute when it is known that the designer is Mr. H. C. Newman, whose fame as a speedman in pre-war days was world-wide, and who has been responsible for more than one very successful engine in the past.

The new unit, which will be shown at Olympia, is of the single cylinder outside flywheel side valve type of exactly the same dimensions as the 349 c.c. two-stroke, i.e. 75 × 79 mm. It has a detachable cylinder head, held down by three full-length bolts, and is chiefly remarkable for the depth and uniformity of the radiating fins on the head and the extremely large streamlined exhaust port. The gaps between the fins joining the valve pockets go right through, permitting free circulation of air to the actual cylinder wall at this point.

Actually the flywheel and crankshaft, and therefore the plain main bearing are the same as in the two-stroke. A cast iron piston is supported on a floating gudgeon pin, the pin itself being retained in position by a light ring encircling the piston. Only two piston rings proper are employed, both above the gudgeon pin.

Provision for Mechanical Oiling.

Lubrication is at present by drip feed, but space has been left in the timing case for fitting a mechanical oil pump inside, if it is found desirable at a later date. Incidentally, it must be emphasised the new engine is not of mushroom growth, it being fully eighteen months since the first experiments began. Road tests have given eminently satisfactory results, and it will be extremely interesting to watch how the new four-stroke compares in general performance with the two-stroke of the same capacity.

Excepting one set of engine plates and the magneto platform, the standard Ivy frame has necessitated no alteration to take the latest engine. The magneto platform is of particularly neat design, allowing easy chain adjustment without danger of upsetting its alignment.

Only one item of importance has been altered in the two-stroke models: the transfer port is now oval instead of rectangular, which allows bridge-pieces to prevent the piston rings fouling to be dispensed with. Also the sparking plug on the 250 c.c. engine has been moved to the same position that it occupies on the 350 c.c. model—diagonally at the rear of the cylinder head.

CURRENT CHAT (continued from p. 659)

Brooklands Sundays.

Notice has just been received by the catering company at Brooklands that the track will *not* be open on Sundays during the winter. No reason has been given by the track authorities for this decision which takes effect after November 12th.

The Cause of a Crash.

In the course of a letter acknowledging the many congratulations he has received on his lucky escape after a spill at 100 m.p.h. in the Brooklands 1,000 c.c. Championship, Mr. George Brough states that his tyre—a Dunlop—was not really to blame, for it was noticed by another rider to be under-inflated at the start.

Lightweight Sidecars on Alms Hill.

First ascent of Alms Hill, Henley, by a lightweight sidecar outfit was made, according to the latest information, by S. M. Greening on a 348 c.c. Francis-Barnett-Jap sidecar in a North London M.C.C. trial on September 9th. This was not known when the honour was claimed for L. A. Welch (O.K. sc.) at a later date. Greening's low gear was 17 to 1. Are there any more claimants?

What You Buy.

An American opinion: "The real appeal of the motor cycle is not merely transportation nor even economy in mileage and general upkeep, but sport. Customers buy not a two-wheeled or three-wheeled automotive vehicle but the finest sport on the highways. For tours, hunting and fishing trips, week-end runs into the country, either by individuals or club organisations, the motor cycle as a solo machine or combined with a sidecar offers the greatest possibilities for red-blooded youth."

B.M.C.R.C. Annual Dinner.

The annual dinner of the B.M.C.R.C. will be held at the Holborn Restaurant at 7.30 p.m. on Tuesday, the 14th inst. All members should make immediate application for tickets, price 12s. 6d., to Mr. T. W. Loughborough, 83, Pall Mall, S.W.1.

How True.

"When a customer begins to argue about the comparative prices of motor cycles and cheap automobiles," says an American paper, "the motor cycle dealer may as well save his breath. As the cure for love is marriage, so the only cure for the flivver-inclined is to let him buy a flivver."

100 m.p.h. in Belgium.

While Le Vack is breaking 100 m.p.h. records at Brooklands, news comes to hand that this speed has been attained for the first time in Belgium. At officially recognised trials on the road at Oostmalle, a rider named Gheude on an American-X averaged exactly 100 m.p.h during his best run for the mean speed kilometre record.

Expert Thieves.

A model H 1921 Triumph with Whitley sidecar (ME 3314; engine 78415 CRT; frame 317631) and Sunbeam silencer was stolen from a private yard in Wood Street, London, E.C., despite the fact that the owner only left it two minutes, had removed the wire from the plug and that the magneto and air controls were reversed on their respective levers.

In a Good Cause.

The Cycle and Motor Trades' Benevolent Fund is holding a "Motor Revel" at the Holborn Restaurant to-morrow (Friday) night, dancing to commence at 9.30 p.m. For non-dancers there will be Jack Hilton's Cabaret Follies, and supper at 11.30 p.m. After defraying expenses the proceeds will go to the fund, which does much good work by relieving distress in the trade.

NEXT THURSDAY! THE MOTOR CYCLE **SECOND SPECIAL SHOW NUMBER.**

RELEASE OF "THE MOTOR CYCLE" FILM.

ARRANGEMENTS relating to the distribution and exhibition of *The Motor Cycle* film are well in hand, and numerous clubs have had dates allotted to them.

No club may have the film before the motor cycle show (Nov. 25th-Dec. 2nd), as from the 27th Nov. it will be included in the programme of The Broadway Cinema, Hammersmith, and will be screened there three times daily until the end of the Show, at 2.30 p.m., 5.50 p.m., and 8.30 p.m. The prices of admission are 8d., 1s., and 2s. 4d. The 2s. 4d. seats may be booked in advance (Telephone: Hammersmith 718).

This year the film is longer and more varied than last, and includes such attractive features as—

M.C.C. Team Trial for *The Motor Cycle* Cup.
Motor Cycle Tourist Trophy races (Senior, Junior, and Lightweight).
London-Land's End Trial.
London-Edinburgh run.
Car Tourist Trophy races.
French Grand Prix (Car and Motor Cycle Races).
Speed events on Daytona Beach (U.S.A.).
American hill climbs.
Snow Car Competition.

T.T. DATES PROVISIONALLY DECIDED.

AT a meeting of the Competitions Committee of the Auto Cycle Union held last Friday, it was decided, subject to the General Committee's approval, that the T.T. Races be held on:—

Monday, June 11th, morning.—Junior Race.

Wednesday, June 13th, morning.—Lightweight Race.

Wednesday, June 13th, afternoon.—Sidecar Race.

Friday, June 15th, morning.—Senior Race.

It is suggested that all entrants shall submit for inspection the silencers they propose using, also that the full equipment of the winning machines will be announced by the A.C.U. It was also proposed to recommend to the General Committee that a T.T. Race be organised for cycle cars with engines not exceeding 1,100 c.c.

The dates suggested are a clear three weeks after Whitsuntide, which is much better than last year, when the races synchronised with the busiest week of the manufacturers.

MORE 100 M.P.H. RECORDS.

H. LE VACK on the 100 m.p.h. Zenith-Jap broke six further remarkable records last week.

He averaged over 102 m.p.h. mean speed over the mile and kilometre distances, and attained over 103 m.p.h. by the one-way mile; he also broke the corresponding sidecar records.

Then, as was inevitable, C. G. Pullin captured another, this time on the 500 c.c. Douglas.

Full details of the records are as follows:

H. LE VACK (998 ZENITH-JAP). CLASS E (1,000 c.c. SOLO).
FLYING KILOMETRE (British Record):
(Mean) 21.76sc.=102.80 m.p.h.=165.44 km.p.h.
FLYING MILE (British Record):
(Mean) 34.98s.=102.91 m.p.h.=165.61 km.p.h.
FLYING MILE (British Record):
(Normal) 34.71s.=103.71 m.p.h.=166.90 km.p.h.
H. LE VACK (998 ZENITH-JAP SC.). CLASS G (1,000 c.c. SIDECARS).
FLYING KILOMETRE (World's Record):
(Mean) 25.825s.=86.62 m.p.h.=139.40 km.p.h.
FLYING MILE (World's Record):
(Mean) 42.15s.=85.40 m.p.h.=138.13 km.p.h.
FLYING MILE (British Record):
(Normal) 41.99s.=85.83 m.p.h.=139.43 km.p.h.
C. PULLIN (500 DOUGLAS). CLASS C (500 c.c. SOLO).
FLYING MILE (World's Record):
(Mean) 40.63s.=88.59 m.p.h.=142.57 km.p.h.

TYPES OF MODERN MOTOR BICYCLES.

499 c.c. Rudge Multi.

AT THE CAR SHOW.

A Motor Cyclist's Impressions. Everyman's Motor Car Still Awaited.

ACCORDING to the pundits who fill the "motor notes" of the daily papers, and even according to some of the more disgruntled members of the motor cycle industry, the day of the small, cheap runabout car for everybody is at hand.

The present exhibition at the White City and Olympia does not bear out the impression which has been so sedulously cultivated in many quarters. True, there are small four-wheelers to be seen in both buildings, but there are only one or two likely to appeal mechanically to the experienced motor cyclist, while on the financial score the choice is equally limited.

Interest in Low Prices.

At the same time the dense crowds which assemble around some of the very small and low-priced vehicles indicate a strong interest in the economy type of machine, and tend to show that there is a potential market for sound runabouts. It seems doubtful, however, from the enquiries addressed to the salesmen, if the majority of those interested have ever previously possessed a motor vehicle; the general tendency seemed to be to judge a machine on price, colour scheme, and whether the body is a nice fit. With most people at the Car Show, from Rolls buyers downwards, it appears to be the thing to choose the car as one buys shoes, by "trying on," as it were.

This method of selection strikes the motor cyclist as rather amusing, while the young Apollos in spats and faultless soft collars that never wrinkle, and who simply exude salesmanship "courses," are in many cases not too anxious to discuss technicalities; in this they are aided by a becoming modesty on the part of many small car firms with regard to displaying a chassis, naked and ashamed, to the public gaze.

Although it does not follow that bodywork hides a multitude of sins, the lack of a bare chassis does much to rouse the suspicion of a motor cyclist, who is usually of a practical and inquiring turn of mind.

Air Cooling.

Air-cooled engines of motor cycle type are to be seen on quite a number of vehicles, and in some cases chain transmission is adopted. The most prominent in what appears to be a disappearing rather than an incresing cycle car class are the Bleriot Whippet (Blackburne twin engine, three-speed and reverse, chain drive, £155), the Tamplin (J.A.P. engine, three-speed and reverse Sturmey gear, chain drive, £150), and the R.T.C. (J.A.P. engine, automatic variable pulley gear, belt drive, £160).

The phenomenally cheap Rover "8" at £180, the Belsize-Bradshaw (£235), the Lea-Francis ditto (£190), and the 90° twin-engined Stoneleigh (£185), Buckingham (£185), Princess (£245), B.S.A. (£230), and G.N. (£215) are all "cars" in the full sense of the term, albeit air (or oil) cooled. Undoubtedly the cycle car world has lost its brightest upholder and exponent by the apostasy of the G.N.; the abandonment of the chain transmission, the introduction of a water-cooled four-cylinder engine and the adoption of a "de-gingered" twin for the sake of quiet running, have been received with mixed feelings by many interested in the true, but still undefined, cycle car.

One of the most interesting machines at Olympia is without doubt the Trojan, a two-stroke four-seater at £175, from the Leyland factory. This somewhat curious vehicle has solid tyres which are rendered possible by a very supple springing. The engine is a side-by-side twin laying horizontally under the floorboards; it has a two-speed epicyclic gear upon an extension of the crankshaft, and drives to the solid back axle by a duplex chain. Compared with the best motor cycle practice the whole machine is crude and roughly finished, but if its road performance is successful it may have a following which, however, is unlikely to be recruited from the ranks of the motor cyclists.

Clean Continental Design.

Amongst the larger cars there is much to attract anyone interested in cleverly-designed and finely-constructed mechanism, but when the smooth, completely enclosed overhead valve units of some of the more modern (especially French and Italian) cars are compared with the complicated mass of pipes, bolts, studs, plugs and wires on, say, the Rolls-Royce, one cannot do other than wonder. At any rate, a motor cycle on Rolls lines, without a bonnet, would never do.

Some of the miniature French cars—Mathis or Benjamin, for example—have delightful little engines; just square boxes like petrol tins standing on the narrow side. Only the sparking plugs are exposed. It seems quite possible that these small, smooth engine units could be applied to motor cycle use. Would it be worth the extra complication of water cooling to have an engine that could be rubbed over in twenty seconds with an oily rag?

One miniature car, the Austin "7," was shown in chassis form, and it appeared particularly attractive—much more so, indeed, in that way than when fitted with the undignified bodywork which it is doomed to carry. The chassis is small in the extreme, and the control levers, rods, and fittings generally are reminiscent of the A.B.C. motor cycle; they are certainly on no bigger scale.

Too Much Expected.

Summing up, the 1923 Car Show seems to indicate that the true cycle car is moribund through over-development; even the tiny 700 c.c.-800 c.c. vehicles have to carry four-seater all-weather bodies, and it is a rare car owner who is content without an electric starter. Motor cyclists demand from their machines high road performance; the car world seems to place comfort and silent running first. With one or two exceptions the small and moderate priced vehicles at Olympia appear to be designed more for suburban shopping expeditions than for go-anywhere touring work which is usually demanded of big sidecars.

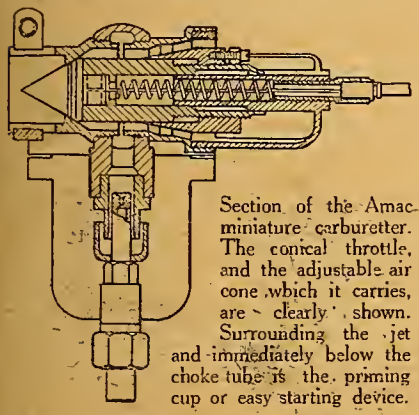
Full details of the exhibits at the Car Show will be given in to-morrow's issue of "The Autocar" . . . . Price 4d.

MINIATURE AMAC CARBURETTER.

New Instrument of Great Simplicity to meet the present Trend of Lightweight Design.

THE introduction of many ultra lightweight motor cycles has naturally caused a demand for carburetters to suit; and the firm of Amac, Ltd., is among those to tackle the problem.

The new instrument is of the single-lever type, and is so simple in action and in adjustment that it should prove particularly suitable for the type of vehicle for which it is intended. Apart from the float, which is of the usual Amac type, but on a smaller scale, there is only one moving part which takes the form of a combined throttle and air slug. Cast on the top of the float chamber is a protruding ring into which may be screwed suitable inlet and outlet pipes. This arrangement is particularly handy since by reversing the positions of the two pipes a left- or right-hand float chamber position can be obtained.



Section of the Amac miniature carburetter. The conical throttle, and the adjustable air cone which it carries, are clearly shown. Surrounding the jet and immediately below the choke tube is the priming cup or easy starting device.

Inside the outlet pipe is a restriction in the bore which is closed by a taper throttle valve, the body of which extends rearwards and is screwed externally at the back end; on this screw is mounted a second taper plug of larger diameter which forms the air valve, and this may be locked in any desired position by tightening a set screw.

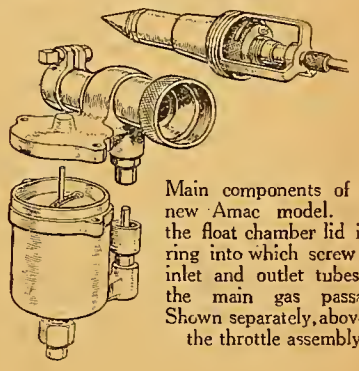
Mixture Proportions can be Varied.

The tapers are such that the carburetter, as supplied, will give approximately correct results, but by screwing the air valve along the body of the throttle valve any desired variation in proportion of air to petrol mixture may be obtained. The peculiar type of valve used, of course, provides an annular space for the air flow, and it is employed because the usual type of throttle is apt to permit of a certain amount of air leakage, a feature highly detrimental in the case of tiny engines.

Easy starting is a *sine qua non*, and provision is made to ensure this desirable feature in the latest Amac. This takes the form of a cup surrounding the jet which is placed in a normal position at the side of the float chamber; into this cup dips a choke tube which surrounds the jet. In normal circumstances the air passes direct up this choke tube, but for starting purposes, if the carburetter is flooded, the cup is filled with petrol which submerges the base of the choke tube. Thus a heavy proportion of petrol is bound to be sucked into the engine.

So simple is the construction of the carburetter that anyone might dismantle the instrument without fear of upsetting the adjustment.

Either top or bottom feed to the float chamber can be supplied, and the usual dimensions of the stub pipe are $\frac{3}{8}$in. and $\frac{5}{8}$in. internal diameter.



Main components of the new Amac model. On the float chamber lid is a ring into which screw the inlet and outlet tubes of the main gas passage. Shown separately, above is the throttle assembly.

REVERSE GEAR FOR MORGAN RUNABOUTS.

Two Ingenious Conversions Greatly Improving Ease of Handling.

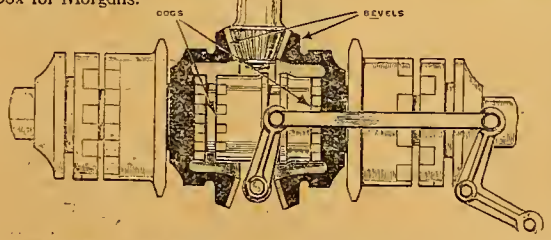
PERHAPS the only real criticism which can be urged against the general handiness of the Morgan three-wheeler is its lack of a reverse gear, which makes turning in narrow lanes or backing out of a garage somewhat laboursome.

One of our readers, however, Mr. L. Anderton, of 17, Abbey Grove, Bolton, Lancs, convinced that the application of a reverse gear to the Morgan transmission was by no means difficult, set about the task of effecting a conversion. Two methods were finally evolved, both of which have been tested and found satisfactory. One is a thoroughly mechanical method, which must have suggested itself to many Morgan owners, the other is very ingenious, but somewhat crude, yet it has the advantage of being easily fitted without removing the body or the existing gear box.

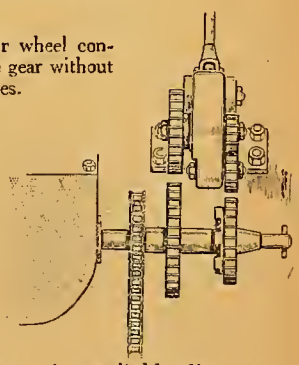
Reversing the Primary Reduction.

As is well known, the Morgan transmission consists of two separate chain drives of different ratio to the back wheel from a low-speed countershaft, which is driven by a shaft and bevel gear from the engine. It is obvious that if two crown wheels could be used, one on each side of the shaft bevel, and alternately locked to the countershaft as required, the latter would revolve either forward or backward, according to whichever crown wheel was in operation. This is the principle of the first conversion, and it necessitates a special bevel box, which is fitted in lieu of the existing Morgan box. A special countershaft, with a squared centre, runs through this box, and on it is mounted a double dog clutch and two crown wheels, meshing with the original bevel pinion. By means of a special lever either crown wheel may be dogged to the countershaft to obtain the desired forward or reverse motion.

(Left) Arrangement of crown wheels and dog clutches in Anderton's reversing bevel box for Morgans.



(Right) An alternative spur wheel conversion set giving a reverse gear without structural changes.



In the second conversion set the Morgan low gear sprocket has a toothed wheel mounted on its boss, and a new sliding dog is fitted, also compounded with a toothed wheel. Mounted on a chassis cross member, at a suitable distance, a swinging bracket is fitted, which carries a spur wheel, engaging with one of two others mounted on a common shaft.

To bring the reverse motion into operation the clutch is disengaged and the Morgan gear placed in neutral; the swinging bracket is then moved by means of a separate reverse lever until its single wheel meshes with the pinion on the low gear dog, and the remaining one of the pair on the common shaft engages with that on the low-gear sprocket. When the clutch is again engaged the sprocket is driven in the reverse direction from the pinion on the low-gear dog through the train on the rocking lever.

IDEAS: USEFUL AND INGENIOUS.

A Selection of our Readers' Home-made "Gadgets," with Practical Hints on Work in the Garage and on the Road.

Heat for Self-Sealing Tubes.

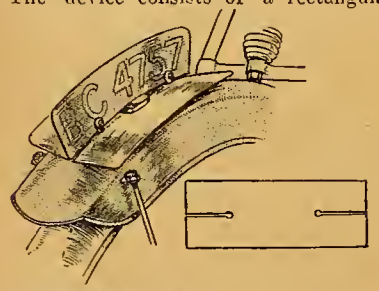
THE other day I was rather surprised to find my back tyre growing flabby, as it contained a Challenger self-sealing inner tube, which had previously defied a variety of metal objects which had been extracted without loss of pressure. However, there was no doubt on this occasion that the Challenger was not functioning perfectly, so out it came. On examination a piece of glass had inflicted a clean, straight gash perhaps ¾-in. long; the sealing process, always so promptly operative with reasonable punctures, had evidently commenced, but was not wholly effective. I tried the effect of ironing the gash with a domestic flat-iron just not hot enough to scorch the rubber, and found that when heated the mastic expanded enough to close the cut. Presumably, even this gash would have sealed itself if it had been sustained after a long run had heated the tube; but the triangular bit of glass was picked up on a very short expedition.—B.H.D.

Illuminating Front Number Plates.

THERE are no doubt many solo riders who find the lighting of their front number plate far from satisfactory, and in consequence have the fear of being pulled up by the police when night riding.

A reflector of the kind made by A. K. S., of Leicester, out of a piece of an old oil tin, and which requires no screws or rivets, will enable them to ride with their minds at ease.

The device consists of a rectangular



Reflected light is used in this idea to make the number plate visible at night.

piece of thin sheet iron cut with longitudinal slots at each end and enamelled white on the upper side; the slots are necessary to permit of bending to required shape.

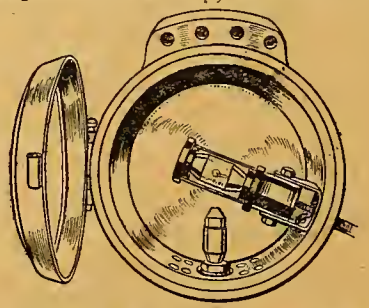
The two screws holding the number plate and the plate itself are removed; then the reflector is dropped over the lugs and the number plate and screws replaced. To hold the reflector firm and prevent rattle, a pad of rubber with a groove cut in it, into which the bottom edge of the number plate presses, may be fitted.

On a dark night away from all street lamps it was found that without the reflector the numbers could not be read beyond 6 yds.; with reflector they could be read at 20 yds.

It is best to experiment with a piece of white cardboard first to get correct size and bending, as number plates vary.

Home-made Auxiliary Head Lamp.

THOSE who are not wealthy enough to acquire a first-class dynamo outfit, and who, in consequence, remain faithful to acetylene for the sake of its cheapness and efficiency, find their worst



Ex-R.A.F. instrument lamp used as a "short distance" illuminant in an acetylene head lamp.

trouble is the need of having speedily to summon enough gas for five minutes' town riding, or for that last mile or so from home. The device of W. J. F., of Finsbury Park, to overcome this disadvantage is cheap and economical, but it must be understood that it is intended for use in lighted thoroughfares, where illumination of the ground is not necessary, and not for dark roads, except, of course, in case of emergency.

The head light consists of an R.A.F. surplus dashboard lamp of 2.5 volts 0.1 amp (costing about 8d.), swivelled on its bracket. As shown in the sketch, this bracket is riveted or screwed to the lamp body in such a manner that the bulb-holder is over the jet, and central in relation to the reflector, and able to be swivelled forward when it is desired to burn gas. To attain this object it may be necessary to shorten the bulb-holder, but this, of course, depends on the size of one's head lamp. Of the inner and outer portions of the bulb-holder, all but two diametrically opposed strips should be cut away so as to obtain as much light as possible.

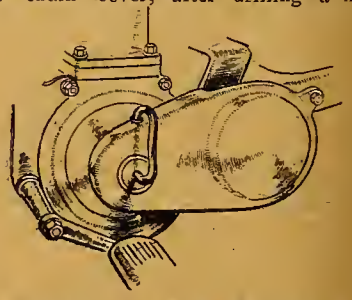
Current is best derived from a 3-volt dry battery of reputable make—a suitable size will cost 3s. to 4s. (and that only if one's researches for surplus stores should prove unsuccessful), and will last for months with intermittent use—carried on the steering head or rear stay in a tin or wooden case, which can easily be constructed for a few pence.

An additional useful fitment is to insulate the holder from the bracket by means of washers, and fix a small strip of metal on to the bracket in such a manner that contact is formed only when the lamp is in its working position. This is invaluable if, as in W. J. F.'s case, a rear lamp of the same elements is run in parallel from the same battery, the rear lamp can thus be used with the acetylene head lamp without necessitating removal of the front lamp.

Automatic Chain Lubrication.

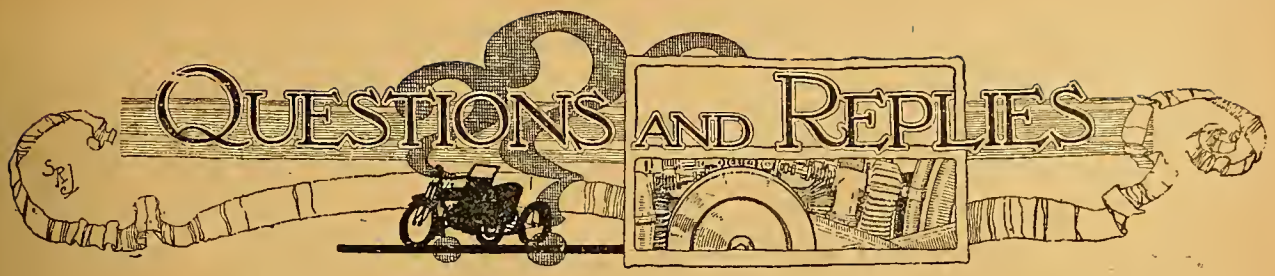
USERS of machines on which the primary chain does not run in an absolutely completely enclosed case frequently discover that the links are dry or show signs of rust, while the rear chain, often with much less protection, remains fairly well lubricated. The reason for this, of course, is that the high speed of the chain causes the oil to be flung off by centrifugal action.

This chain lubrication problem was overcome by W. H. B. of Southport, the owner of a countershaft Trinmph, by soldering a short length of ⅜in. copper pipe on to the centre of the name-plate on the chain cover, after drilling a hole



Oily vapour blown from the crank case release is led to the top of the primary chain sprocket.

through opposite the main-shaft centre. Suitably bent, the other end of the pipe enters the lubricating hole above the top run of the chain. Oil mist blown through the hollow engine-shaft is led directly to the chain, and the originator of the idea claims a doubled life for his chain.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality

OILED PLUGS AND SPARK GAPS.

Owing to my 1921 770 c.c. twin oiling up the plugs to an annoying extent I have fitted a proprietary make of spark gap; will this cause any harm to the engine or the magneto?—P.J.L.C.

If the use of various makes of sparking plugs fails to remedy the trouble make sure that you are using suitable oil. Assuming of course that the oil supply to the crank case is not excessive it is quite possible that your trouble is due to faulty piston rings, allowing an excess of oil to reach the combustion chamber. Fitting spark gaps will not harm either the magneto or the engine, providing that they are not of abnormal width: they should be of considerable assistance in preventing stops due to oily plugs.

TUNING A LIGHTWEIGHT.

In tuning an Omega-Jap for speed I propose fitting an aluminium piston. Would I obtain any benefit also from the following alterations? (1) Fitting an extra valve in the exhaust cap. (2) Lightening the valve heads. (3) Fitting the carburetter against the cylinder instead of at the end of the ordinary induction pipe. (4) Larger choke tube in the B. and B. single-jet carburetter with a larger jet to suit.—H.P.B.

All the modifications which you suggest carrying out are worth trying if you wish to get the maximum speed from your machine, and if well done would no doubt have the desired result. It is impossible to say, however, either individually or collectively that the modifications suggested will attain the desired end. Tuning for speed is entirely a matter of continual experiment and test: even the most successful racing men have to proceed by a process of trial and error. This first suggestion is perhaps the least profitable one, and it should be left until everything else has been tried.

STARTING GEAR.

Will you kindly advise me on the following. My lightweight is fitted with a Sturmey-Archer hub gear and pedal starter, which starter I have never used; I am now desirous of fitting it up, but on close examination in order to ascertain the size of chain necessary, I find that the sprocket of the hub does not correspond with the wheel attached to the pedal. The hub wheel has 22 teeth, each being ½in. from centre to centre. The pedal wheel has 32 teeth, each being ⅝in. from centre to centre; thus I assume that the same chain will not work on both. Shall I have to get a new pedal wheel or a new hub chain wheel, or do you think that if I purchased a chain to suit the pedal wheel it would work—for the purpose of starting—on the hub wheel. I may say that I do not desire to spend much on it.—W.A.G.

You cannot very well alter the chain ring on the free-wheel of the three-speed hub gear, as these are standard. It will be necessary to use a chain wheel of the same pitch on the bottom bracket of the machine; the one now fitted is apparently ⅝in. pitch and what you need is one of ½in. pitch. There should be no difficulty in obtaining a suitable wheel, but you may have to get a new right-hand pedal to carry it. Order a wheel for ½in. pitch chain, and make sure that the teeth are the same thickness as those on the free-wheel of the hub (probably ⅛in.), and you will then have to get a chain to suit, *i.e.*, ½in. × ⅛in. or ½in. × 3/16in., as the case may be. Do not get a wheel with more than 40 teeth.

SLIGHT PRE-IGNITION.

Since fitting a sidecar to my 550 c.c. Triumph I notice a "tinkling" kind of noise at times (especially on slight hills or against the wind) which can be stopped by retarding the ignition about one third. I only notice this at round about 20 m.p.h.; over this speed I do not notice it. The timing is correct and everything appears to be tight, engine decarbonised two or three weeks ago and all bearings, etc., perfect. It is certainly not a knock. Is it "pinking"? (I never quite know what the latter really is). I find my outfit runs and picks up nicely on top gear at 10-12 m.p.h. on the level with ignition nearly fully (say ¾) retarded. Is this harmful or likely to cause overheating?—H.E.

The noise you describe is that form of pre-ignition knock which is generally described as "pinking," and it can usually be cured by retarding the spark, by altering the nature of the mixture admitted to the combustion chamber, or most effectively of all, by an admixture of benzole in the fuel. This will not cause overheating, neither will it be harmful to the engine provided it can be accomplished without any signs of obvious stress such as knocking or a marked "snatching" in the transmission. From the general behaviour of your engine it would appear advantageous to slightly retard the ignition timing.

"THE AUTOCAR" THE COMPLETE JOURNAL.

Every phase of automobilism is embraced by "The Autocar," the sister journal of "The Motor Cycle."

Light, medium and large cars are adequately covered in its pages. No artificial division of light cars from other types is attempted, or, indeed, is necessary, since the principles of design are identical and the interest of users, whether concerning questions of upkeep, taxation, roads, service or future development, are undivided and common to all.

Thus, "The Autocar"—the pioneer and the largest of all motor journals—forms the only complete record of the automobile movement, by embracing the interests of motorists in general.

SHOW REPORT NUMBER NOW ON SALE.

CONDENSATION ON INDUCTION PIPE.

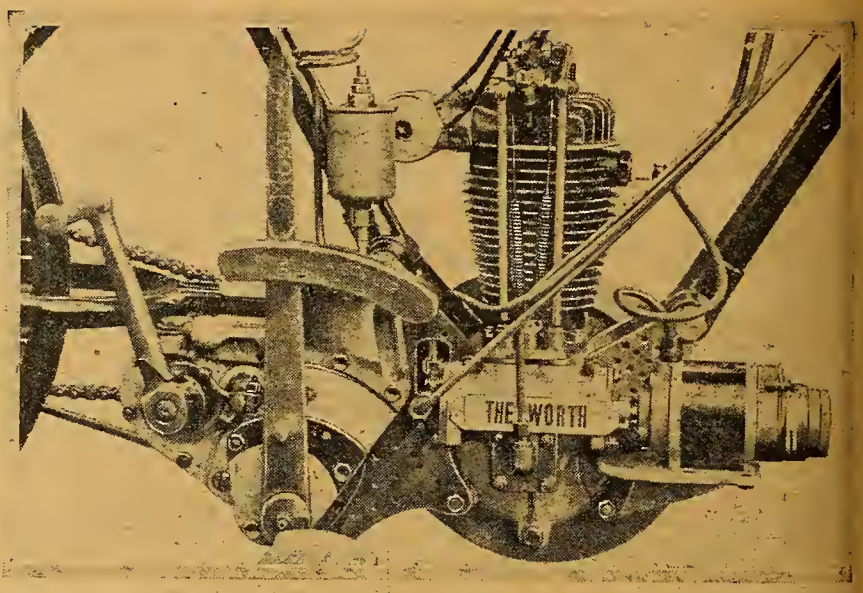
? My machine, a 1921 348 c.c. Douglas, seems to be very erratic in firing. It starts away quite well after flooding the carburetter, but after a few yards begins to miss. This lasts for a hundred yards or so, when it suddenly fires quite well on both cylinders and runs splendidly for a minute or so, and then starts to miss again. On stopping I find the induction pipe is extremely cold, and there is a lot of moisture (not petrol) round the pipe where the carburetter joins on. After standing for a short time the pipe gradually warms up and the machine will start quite normally till a few minutes later, when the pipe is freezing cold again and more moisture appears, which is presumably the warm atmosphere condensing on the cold pipe. Both cylinders are equally hot, so evidently it is not one cylinder only that is firing. I have tested both plugs, which give a good spark, and there is no leak in the induction pipe, either at cylinder joints or where the carburetter joins on. I have thoroughly cleaned the carburetter, and am satisfied that there is no stoppage in the passage from the tank, and the float chamber fills directly the plunger is pressed down. The valves seem quite all right, and so presumably is the timing, as this has never been interfered with. I may mention the machine was running perfectly last week, and the trouble has therefore come on quite suddenly.—E.S.B.

No doubt the recent cold weather accounts largely for the change in the running of your engine. The condensation on the induction pipe is due to the exposed position of the carburetter, which may have to be heated either by exhaust jacketing or by a warm air intake. Before proceeding further, wrap the induction pipe with asbestos string and insulation tape. Weak mixture will exaggerate the symptoms, so it would be advisable to fit a slightly larger jet.

PREVENTING BELT SLIP.

? Being the possessor of a 1921 chain-cum-belt driven Triumph, can you give me the details of the system employed by Miss Cottle, the North Wales competition rider, to deliver "belt grip" to the pulley whilst riding, and if it is applicable to my machine? Reference has been made to the device on more than one occasion.—C.G.

There is very little to add to the references to the belt slip preventing arrangement which you mention. The device is merely an ordinary screw-down grease gun with a pipe leading to the back of the countershaft pulley. On the end of the pipe is an acetylene tubing "Y" piece. The gun is filled with any of the well-known belt grip preparations which are on the market, and as required a little is forced through on to the pulley flanges, where it comes into contact with the sides of the belt.



FOUR VALVE 250 c.c. ENGINE. Fully described in our isssue of October 26th, the Worth engine attained a speed of over 50 m.p.h. on its initial run. Incidentally its name was derived from the motto of its town of origin (Keighley)—"By Worth."

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stomp.

SPARKLETS.

Lapping at 100 m.p.h.

H. Le Vack, who broke a world's record in class "E" by covering five miles at 100.29 m.p.h., was using an M.L. magneto on his 976 c.c. Zenith.

Cheaper Lubricants.

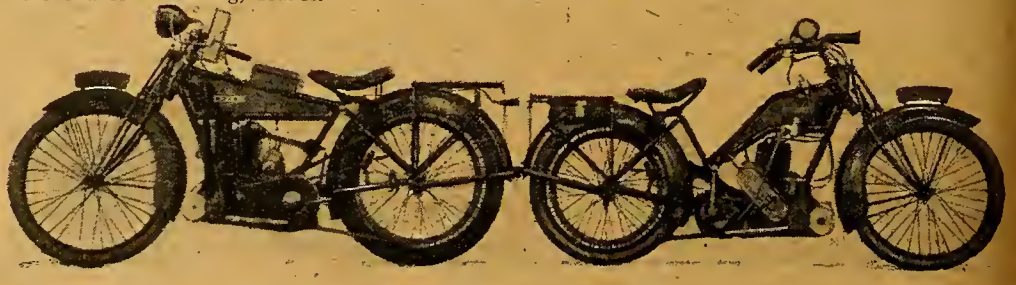
Prices' Company, Ltd., has made reductions in the prices of motor lubricants; the revised rates came into force on the 3rd inst. Those interested may obtain price lists by applying to Prices' Company, Ltd., Battersea, London, S.W.11.

Overseas Successes.

A brilliant victory was gained by the Douglas team in the 176 mile race for the Harley-Davidson Shield, which took place recently in South Africa. A further success was that of G. Shepparson, who, riding a 348 c.c. Douglas, won the three and five mile events at the Weston Motor Cycle Races, Ontario, Canada.

Polishing Aluminium.

Owing to its comparative softness aluminium is easily abraded by coarse polishing materials; no criticism in this respect can be directed against Alupol (Metalastene Co., Poulton-le-Fylde: price 1s. 3d. per tube), which we have found to be very effective for polishing this metal.



Unless compared side by side the size of the various models cannot easily be judged. This illustration depicts two Cedos models—a 26in. wheel sports model and a 24in. wheel lady's mount. The difference in saddle height is appreciable.

THE BINKS CARBURETTORS ARE the most flexible and economical in the world

THE BINKS 3-JET CARBURETTOR is both an investment and a pleasure.

IT WILL REDUCE YOUR PETROL BILL BY AT LEAST ONE-THIRD.

AT the same time it will impart a marvellous flexibility to your machine—make it docile in traffic and give ample power for touring in hilly country, and allow greater speed on the level.

A Real Extra Air Valve is incorporated to allow you to coast downhill on pure air and use your engine as a brake.

FIT A BINKS TO YOUR MACHINE & SAVE MONEY

Thousands of gentlemen have already done so, and are now delighted owners.

Are you interested in

LIGHT CARS?

Readers of "The Motor Cycle" who are considering the purchase of a small car will find all the information they desire in the pages of

The Autocar

Every Friday. FOURPENCE

"THE AUTOCAR" deals with *every* phase of motoring, and very fully covers the small car movement.

All the known makes of light cars are advertised in "THE AUTOCAR."

Bargains in second-hand light cars are more likely to be secured through "THE AUTOCAR" than any other medium

Because—

More second-hand light cars are offered for sale in "THE AUTOCAR" than in any other motor journal.

Published by
Iliffe & Sons Ltd., Dorset House, Tudor St. London. E.C.4.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements the mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6 and on all transactions over £100, ½%. All deposit letters are dealt with at Dorset House, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Our Burlington sidecars is such as to meet all requirements. For distinctive design and excellence of workmanship they are without equal. Our Art Brochure describing our nine different models will be mailed you upon request.

SEMI-SPORTS MODEL.

In this model we have endeavoured to produce a sporting sidecar giving the comfort of a touring model. It is impossible with an ordinary photograph to do justice to the beauty of line and pleasing contours of this body. Richly upholstered in antique leather cloth, with detachable spring seat and well sprung back, it is the acme of comfort, although retaining its striking sporting appearance. The large rear locker is provided with hinged top and a lock, and is accessible without disturbing the passenger.

Approximate weight of body—48 lbs.

CHASSIS.

Underslung type, four point attachment with accurately machined fittings, enclosed and easily detachable wheel, with wide mudguard, 26 in. wheel, fitted with tyre 26 in. by 2¼ in. Other sizes to order.

Price, complete with waterproof apron, £26

We can also supply this body with our lightweight chassis, suitable for machines up to 3½ h.p., at £21.

TRADE SUPPLIED.

Applications for agencies are invited.

Winter Riding

holds no terrors when—

Stepney

equipment is used:

"Road-Grip" Tyres

are universally firm favourites throughout motordom. All-Rubber, they grip with Bull-dog tenacity on mud, grease, snow, wet tramlines, and in addition they give the extra mileage that means so much.

"Stepney" Inner Tubes

built of specially toughened Red Rubber and made for hard service. Test one on your rims. Also the—

"Samson" Inner Tube

is all that its name suggests. Extra thick for durability and puncture prevention Prevents nipping when fitting.

YOUR MONEY BACK.

Book your order with me for your

1923 2¾ H.P. DOUGLAS

the finest machine at the finest price in the world. I tune them up to do 55 m.p.h., and if the price is reduced for the 1923 models, which I can now deliver, I will refund the difference. Ask for particulars of the Coram-Douglas, a special bus of merit.

Fitted with—

ZOOM! ZOOM!! The popular Exhaust System. Beautifully made, finished in burnished nickel or copper. A pleasant Zooming note without back pressure. Adds pounds to the appearance of any Douglas. Price **30/-** in copper finish, **33/6** nickel.

Fitted with—

THE TONY COMBINED ALUMINIUM FOOTBOARD AND FOOTRESTS. Beautifully finished—giving a natural riding position. A real solid cast job. Something that lasts for ever. Price **30/-** per pair complete.

Fitted with—

AIR COOLED VALVE CAPS. My latest are covered by patents. They never blow out nor seize in the threads. Absolutely gas-tight. Prevent knocking and keep the engine cool. Try them on your 2¾ h.p. or 4 h.p. Douglas, and if you are not absolutely satisfied have your money back. Price **4-/-** each.

Fitted with—

THE CORAM PISTON, fitted with radiating internal fins. Correctly designed, much lighter yet stronger than standard. Fitted with the patent twin rings in one groove. Complete with rings and gudgeon pin. Price **29/-** per pair. Insist on having these fitted when your mount is next down, and you'll never regret it.

Fitted with—

TWIN RINGS. Two rings in each groove give more power—perfectly gas-tight joints—prevent carbonising, as oil cannot pass them—wear indefinitely—need no running in. For 2¾ h.p. Douglas **1/6** each. 4 h.p. Douglas **1/8** each. Williamson, Sunbeam 2¾ h.p. and Humber twin, **1/8** each. Sunbeam, 4h.p. All Blackburn 4 h.p. engines, Triumph, Coulson, Sheffield Henderson and Wilken 4 h.p. B.S.A. 3½ and 4½ h.p. Rudge, Singer 3½ h.p., New Hudson, L.M.C., J.A.P., 8 h.p. A.J.S., etc., **1/9** each. Other makes quoted for on application.

OTHER DOUGLAS SPECIALITIES I MARKET:—

You will appreciate this convenience for 4 h.p. Models. A funnel, Oil Filler, and Crankcase, Compression Reducer combined. Neat and out of the way of dirt. You can get the last drop out of a can without soiling your hands; fitted in a jiff. Price only **10/6.**

20% POWER INCREASE This is what the new pattern cylinder gives a 2¾ h.p. Douglas. It has streamlined ports, and large radiating fins. My price per pair is only **£5.** Fit them to any old model Douglas and you'll really be surprised.

Any Douglas or Williamson Spare for any model by return post. Everything I sell is guaranteed on the money back principle. I was 10 years with Douglas Motors, Ltd., and specialize only in Douglas Motor Cycles, therefore I can give you better Douglas Service than any other Agent. I shall be on the Douglas Stand during Show week, so look out for

W. G. Coram

MIDDLETON'S Spriag Wheel Sidecar again wins Championship at Brooklands, making third successive year. Le Vack (Zenith-Jap) first, O. de Lissa (Motosacoche) second.

MIDDLETON'S Spring Wheel Sidecar again used for records. 50 miles, 100 miles, one hour, by Messrs. Temple and Allchin, on the famous Harley-Davidson.

MIDDLETON'S Spring Wheel Sidecar was used by the winners in the 200-mile race, Messrs. Davidson (Indian) and Le Vack (Zenith).

MIDDLETONS Supply on extended payments if so desired.

MIDDLETONS cater for New Poor and New Rich alike. Our sympathies are, however, with the former. We know how it feels, never having been anything else, for, as you are probably aware, we make nothing out of sidecars, just doing it, like the artists' model, for a bare living.

MIDDLETONS, London's Oldest-established Sidecar Makers. Business hours, 9 to 6; Saturdays, close 12. Sundays, like the Scotsmen, we stop in bed for economy. Saves wearing out boots, you don't need a fire, and it keeps the appetite down.—27, Stroud Green Rd., Finsbury Park. 'Phone: Hornsey 1584. [0522,

4h.p. Douglas Sidecars, new chassis complete, new body painted maker's colours, despatched anywhere on approval; £12/10.—Cleare and Co., 125, High St., Woolwich. 'Phone: 174. [9496

HOPLEY Folding Sidecar Saves Garage; attached to motor will go through passage 28in.; tandem bodies fitted; suits motors up to 10h.p.; changed from pleasure to commercial in few seconds; tested 8 years.—F. Hopley, Upper Highgate St., Birmingham. [0152

PARAGON (patent) Folding Sidecar saves storage, has 7 years to its credit, and has proved itself absolutely reliable. Fits any make of motor cycle, and, when folded, combination will pass through a 30in. doorway. Call and see it demonstrated.—Wincycle Co., Ltd., 236, High Holborn, W.C.1. [0388

RELIANCE Magneto Repairing Co.

RELIANCE for repairs, new magnetos and spar parts.

RELIANCE have the largest and most up-to-dat repair factory in London.

RELIANCE carry out all repairs on the premises including armature winding.

RELIANCE have one of the most modern winding plants and test rooms in the country, and can therefore offer you the following advantages.

TIME.—All work within 6 to 48 hours, and a solid 12 months' guarantee in writing to back it up.

CHARGES.—No flat rates. You are charged according to the work that is required, therefore you are not in some cases helping to pay for other people's repairs.

OUR Offer.—We shall be pleased to allow you to see your magneto on test after repair at our works. How many others can make the same offer?

RELIANCE have the following magnetos in stock, all fully guaranteed.

THOMSON-BENNETT.—Singles and twins, new, any degree, waterproof, variable, suit any engine; price 55/-.

C.A.V. singles and twins, new, ideal for any light weight, 2¾h.p. and 4h.p. Douglas; 55/-.

BOSCH type Z.A.2, second-hand, enclosed, waterproof, variable, latest pattern, for Douglas 2¾h.p. and 4h.p.; £4/10.

ACCUMULATORS, best makes only, for all purposes, any voltage, charged and uncharged, always in stock; send for prices.

BOSCH enclosed, waterproof type D.A.L. magnetos, Government surplus, any degree, ready to fit on Indian, Harley, J.A.P., or any big single or twin. We guarantee these to give you slow running and easy starting, and they are in every way ideal for the big machine; price, carriage paid, £4/10.

GUARANTEE.—Every magneto, no matter what the price or make, is guaranteed by us. Not merely that same is in good order at time of sale, but a plainly written statement that we guarantee each machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors. List sent post free upon application.

RELIANCE were established in 1914, since when we have enjoyed a reputation which is second to none for straight and fair dealing.

RELIANCE Magneto Repairing Co., 283, St. John St., London, E.C.1. 'Phone: Clerkenwell 4290. T.A.: Remagco, Smith, London. [9909

IGNITION, LIGHTING, ETC.

MAGDYNAMO Engineering Co., Ltd., for magnetos, spares, and repairs.

MOTOR Cyclists fit reliable high quality magnetos now and avoid certain failure of inferior magnetos.

BOSCH Enclosed Waterproof Type D.A.L. Magnetos, Government surplus, ready to fit on Indian, Harley, J.A.P., or any big single or twin, gives powerful spark at all engine speeds, makes your engine a real live engine, give you easy starting, smooth and rapid acceleration, high speed, and low fuel and oil consumption with increased power; price only £5 each, postage 1/6 extra; a 12 months' written guarantee sent out with each magneto. We give you satisfaction or refund cash.

PLEASE Note, the above type magnetos were originally manufactured for 200h.p. aircraft engines; therefore we have every confidence in claiming them to be the magneto you require for your big machine. Fit one to-day, and see life with a live machine.

HARLEY-DAVIDSON Owner writes: "Magneto to hand; many thanks for prompt despatch, satisfactory in every way; will recommend to my friends."

ZENITH Owner writes: "Since fitting magneto have completed a run of 250 miles; highly satisfied; will certainly recommend these magnetos."

INDIAN Machine Owners.—Your high-class machine deserves a high-class magneto. We want 1,000 Dixie 42° magnetos; send your magneto and £4 now, and we will immediately despatch you a Bosch D.A.L.

READY to fit on your machine; there are no alterations to make.

WHY is it that the leading Motor Cyclists—the men who know—are almost all sending to us for their Magnetos?

THERE must be a reason; there is; it is because the Magnetos of quality and guaranteed service, supplied by Magdynamo, beat all other Magnetos.

MAGDYNAMO will take your old Magneto in part payment.

REMEMBER your magneto is sent on 14 days' approval against cash per return on receipt of your order; there is no obligation to keep it until you have used it for 14 days on your machine and are satisfied; let us send you one now.

ARE You a Discerning Douglas Owner? Do you want a reliable magneto with 12 months' guaranteed service that will give you starting without worry, a smoother running, and more powerful engine and better results from your Douglas? Then send for a latest enclosed waterproof type Bosch XA2 magneto now, price only £5, carriage 1/6.

C.A.V. Magnetos (not converted starters), ready to fit on Triumphs, B.S.A.'s, Nortons, and I. and M.'s, with 12 months' guaranteed service, price £3/10, carriage 1/6.

THOMSON-BENNETT Magnetos latest enclosed waterproof type (not converted starters), ready to fit on 55° Clynos and 1808 Douglas machines, with 12 months' guaranteed service, price £3/10, carriage 1/6.

MOTOR Cycle and Car Owners, are you testing all your sparking plugs properly? Are you wasting pounds yearly by throwing away good plugs? Fit a Bosch aeroplane hand starter magneto on your garage bench to-day and always have your sparking plug tester at hand, price £2, carriage 1/6.

TRADE discounts and export quotations.—Write, call, or 'phone for terms.

A YEAR'S guarantee on repairs. Before you scrap that magneto, whatever its condition, let us see it; we will rebuild your magneto to look and work like new, no matter what make, within 3 days or 24 hours if urgent, and return it with a written 12 months' guarantee. While your magneto is being repaired we can lend you another free of charge. We could not make these offers if we were not certain of the quality of our work.

YOUR old magneto will be equivalent to new at a low cost. Send us your defective magneto now.

EXPRESS Dixie Repair Service. Your Dixie magneto, no matter what size, rebuilt equal to new and returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

ARMATURE rewinding, no matter what make, type, or size, 11/6. Wound cores from stock.

Sittingbourne, Kent.
August 17, 1922.

Mr. Brodrick,
The South-Western Appliance Co.

Dear Sir,

The St. Helier Building arrived on Saturday, two days before promise of delivery, and we are more than satisfied with it.

We erected it on Wednesday and it went together like clockwork. I am very pleased we left the order with you, as all who have seen it think the value is remarkable and admire the artistic appearance. Trust us and believing it will get you further orders from this district.

Yours faithfully,
THOS. E. KENNETT.

THE REPAIR OF HUB GEARS.

On many occasions we are asked where parts and replacements for Armstrong and Sturmey-Archer hub gears can be procured. We recently paid a visit to the works of the Cromwell Engineering Co., 327, Putney Bridge Road, London, S.W.15, and were extremely well satisfied with the way repairs are carried out to epicyclic and other types of motor cycle gears. All parts are made on the company's premises, and all repairs are skilfully executed. It is interesting to note that during the war the Cromwell Engineering Co. were doing very accurate gauge work. They have special machinery for making gear wheels and for cutting the internally toothed rings used in the two hub gears mentioned. Repairs are also executed to countershaft gear boxes.

Spares.—Ex Government stock, soiled only.—Pulley, 7/6; sprockets, 4/-; chain wheels, 5/-; valve guides, 1/6; valves, 3/-; rocker arms, 2/6, petrol pipes and union nuts, 1/6; piston rings, 1/-; front forks, complete, 60/-; fork links, 1/-; front stands, 3/6; undershields, 8/6; silencers, 10/6; back carriers, 18/6; number plates, 1/6 pair; clutch release levers, 4/6; exhaust pipe spanner, 6d.; oil pipe rubber connections, 4½d.; chain guard stays, 1/-; magneto handle-bar controls, complete, 9/-; knobs for change-speed lever, 8d.; camwheel stud, 1/6; rear wheel rims, 5/3; valve rocker studs, 1/3; intermediate gear studs, 1/6; tappet guides, 1/6; valve cap spanners, 9d; box spanner, 9d.; new tool kits, complete, 21/-; Douglas handbook, your own repairs, 1/6; complete illustrated spare part price list, 6d.—Herbert Robinson, Ltd.

4h.p. Douglas Spares.—Unused ex-W.D. stock frames, new, £5/17/6; second-hand, £4; rear rims, 5/3; back stands, 8/9; hubs, completed, 17/6; worm wheel, 1/-; top back spindle, 2/2; top front spindle, 2/2; bottom front spindle, 2/6; back hub spindle, 2/9; tappet guides, 3/-; valve caps, 2/3; gear box halves, 7/6; camshaft housings, 3/3; elbow to oil tray, 1/3; change-speed lever knob, 8d.; magneto handle-bar controls, complete, 9/-; big end bolts, 4d.; exhaust lifter cams, 5/6; keys for clutch release arm, 9d.; pump driving spindles, 1/6; tappet rollers, 6d.; intermediate studs, 1/6; oil trays, 2/6; levers for clutch release, 4/6; oil gauge glasses, drip-feed, 1/-; flat lubricating glasses, 3d.; head ball races, 1/-; 1915-16 sight-feed lubricators, 8/9; oil pipe rubber connections, 4½d.; oil pump, 10/-; screwed sleeve pinions, 7/6; 19-t. gear wheels, 6/3; 23-t. gear wheels, 6/3; plain sleeves, 5/-; undershields, 8/-; valves, 3/9; valve springs, 6d.; valve collars, 3d. Thomson-Bennett magnetos, 55/-; new cylinders, slightly chipped, 37/6; gear box spanners, 6d.; box spanners, 6d.; Douglas handbook, 1/6; complete illustrated spare part list, 6d.—Herbert Robinson, Ltd.

VALVES.—Best quality unbreakable pattern valves for all makes of motor cycles, 4/6 each.—Herbert Robinson, Ltd.

TOURING Maps of the British Isles.—32 large coloured maps, with key map to sections, in book form; 3/-.—Herbert Robinson, Ltd.

VILLIERS Cylinders, new, slightly chipped fins, Mark 2, 3, and 4; 35/- each.—Herbert Robinson, Ltd.

CYLINDERS.—2¾h.p. J.A.P., 74/-; 4h.p., 6h.p., and 8h.p., 83/-; 3h.p. Enfield, front 59/3, rear 58/6; Humber, 115/-; Sunbeam, 100/-; Rudge, 66/-; Triumph, any year, 86/-; Rover, 117/6; B.S.A., 90/-; Premier, 120/-; 2¾h.p. Douglas, 50/-; 4h.p., 60/-; 3½h.p. Norton, 97/6; Big Four, 100/-; 2¼h.p. Levis, 62 mm., 42/-; 2¼h.p., 67 mm., 47/6; 2½h.p., 73 mm., 45/-; 2¾h.p., 75 mm., 47/6; 4h.p. Douglas, 37/6.—Herbert Robinson, Ltd.

SILENCERS suitable for 2¾h.p. Douglas, complete with union nuts, unused, shop soiled only; 10/6 each.—Herbert Robinson, Ltd.

WHEELS, brand new, suitable for Triumph: front, 35/-, rear 40/-; Douglas, front 30/-, rear 40/-. Other standard sizes suitable for 2½h.p. with 26 by 2¼ rims, £2/17/6 pair; 3½h.p. or 4h.p., 63/- pair; suitable for 6h.p., £4/5 pair. When ordering state measurements of old wheel.—Herbert Robinson, Ltd.

SPECIAL Clearance Bargains.—Back carriers, suitable for Triumph and Douglas, 21/-; 2¾h.p. Douglas chain covers, 3/6; waterproof capes for cycling or motor cycling 5/-; plated French horns, 7/6; tool rolls, 3/-; knee grips, 3/6; dust suits, 15/-; leather helmets, 5/-; Renold's rivet extractors, 3/6; large repair outfit, 1/-; large packet assorted patches, 1/-; toolbags, 7/6; leather gauntlets, 4/11; new Lycett's saddles, grained leather top, large size, 23/-; small, 19/6, 2oz. tins Grip solution, 6d.; petrol-proof enamel in all colours, 1/- and 2/- tin; touring handlebars, 1in. stem, 1in. top and ⅞in. stem, ⅞in. top, 10/-.—Herbert Robinson, Ltd.

B.S.A. New Unused W.D Spares.—Copper clutch plates 3d.; steel clutch plates, 1d.; gudgeon pin bushes, 1/-; gudgeon pins, 1/3; crank pins, 2/9; kick-start cranks, 6/9; crank pin bushes, 2/3; 3-speed gear box pinion, 4/6; free engine actuating lever, 3/6; gear box operating lever, 4/3; inlet cam wheel, 5/3; exhaust cam wheel, 5/6; front fork bottom links, 1/6; ball head clip yokes, 4/6; inlet valve caps, 1/10; exhaust valve caps, 1/9; bottom half front brake, 6/3 valve guides, 2/-, exhaust cam chain pinion, 2/-; pistons, complete, 10/6; valves, 4/6. Pistons.—Best quality, complete with rings and gudgeon pins, suitable for 2½h.p. Premier, 22/6; 3½h.p. Premier, 21/6; 2¾h.p. J.A.P., 17/6; 4h.p., 6h.p., and 8h.p. J.A.P., 21/6; Triumph, any year, 20/-; B.S.A. 19/6, 3h.p. Rover, 20/-; A.J.S., 22/-; Indian Scout, 15/; New Hudson, Sunbeam, Harley-Davidson, Singer, 2½h.p. and 3½h.p., 25/-; Rudge, 27/6, genuine 2¾h.p. Douglas, 14/6; 4h.p., 20/6; best quality piston rings, all makes, 1/6 each.—Herbert Robinson, Ltd., Green St., Cambridge. [8348

PARTS AND ACCESSORIES.

ACLYNO Spares.

MARBLE Arch Motor Exchange.

CLYNO.—5-6h.p. and 8h.p. spare parts; enormous stock; undoubtedly we hold the largest stock of these spares, all brand new at the lowest prices.

CLYNO Riders! If money, time, quick despatch, personal attention to your order, and a guarantee that all parts sent by us are new and undamaged, and your money returned in full if you are not satisfied is what you require, then you cannot do better than send to us.

CLYNO.—We are among the pioneers for Clyno spares, always have, and always will be the cheapest.

CLYNO Riders! It is our aim to make our address the only depot for Clyno spares.

CLYNO.—All goods by post despatched same day as ordered.

CLYNO.—Wheels, 25/-; hubs, 12/6; hub shell, 3/-; cup, 6d.; cones, 1/3; bollow spindles, 2/3; spindle nuts, 10d.; Hoffman 5-16in. balls, 4d. dozen; felt washers, 2d. each; spindles, front or sidecar 6d. each, rear 1/3.

CLYNO.—Cylinders, 50/-; valve guides, 1/6; valves, 2/-; spring, 3d.; valve cap, inlet or exhaust, 1/10; piston, 10/-; rings, 10d. each; gudgeon pins, 1/6 each; bush, 1/-; hollow crank pin, 3/-; crank pin washers, 3d.; rollers, 1d.; exhaust nuts, 9d.; exhaust tappet, 1/9; inlet, 1/-; tappet guides, 1/3.—Below.

CLYNO.—Clutch centres, 12/-; clutch plates, bronze 10d., steel 4d.; small cone nut, 1/6; large, 2/-; screwed centre sleeve, 2/4; outer clutch dome, 8/6; push rod, 1/-; thrust block, 9d.; striking fork, 6/-; starter pinion 18T, 2/6; ratchet sleeve, 2/-; pinion sleeve, 1/-; kick start spring, 4d.; sprocket spindle, 3/-; Ferodo brake liner, 1/-; kick-start quadrant, 10/-.

CLYNO.—Front mudguards for Brampton forks, 7/6; front stand, 4/-; front number plate, 6d.; rear complete with strap, 9d.; C springs, 15/- pair; petrol and oil filler caps, 1/-; rubber pad for bottom of tank, 2d.; front flat leaf spring, 5/-; rear portion of frame, 27/6.

CLYNO.—Our stock of Clyno spares is too well known to ask inspection; at the same time, you are welcome.

CLYNO.—Our latest list is now ready; send for one at once.

CLYNO.—Metal case for carrying spare tube, 1/6; listed 4/6.—Below.

CLYNO.—Brampton or Coventry Chain, ¾×5-16, 5ft.; 12/6.—Below.

CLYNO.—A postcard will bring you a quotation by return for any Clyno part you require.—Below

CLYNO.—Tyres: brand new Stepney rib stud, 26×2½, to fit 650×65, for Clynos; 22/- each.

BRAMPTON heavyweight spring forks, 8in. or 10in. stem, for 1in. bars, brand new ex-W.D.; 45/-; Druid, 35/-.—Below.

DOUGLAS 4h.p. Spares, all brand new, genuine.—Below.

PISTONS, oversize, 5/-; piston rings, 7d.; valves, 1/9; tappets, 1/9; tappet guides, 1/9; small-end bushes, 10d.; big-end bushes, 1/3; gear change quadrants 2/6; rear hubs, complete, 8/-; spindles, 1/9; cups, 7d.; rear brakes, complete, 10/-; rear stands, 6/-; tanks, complete with sight-feed lubricator, etc., 1915 type, new, 35/-; carburetter control wires complete, 3/- pair; only parts as above in stock.—Below.

WILLIAMSON and Douglas 8h.p. Engine Spares; enormous stock of engine parts from 50 per cent. to 75 per cent. under list price, all brand new and genuine; let us know your requirements.—Below.

J.A.P. 8h.p. Spares.—Brand new crank cases, 35/-; double cam gear wheels, 7/6; crank pins, timing side shafts, 3/- each; main shaft timing pinions, 1/9; piston rings, 9d. each; gudgeon pin bushes, 1/6 each; all above brand new.—Below.

P. and M. cylinders, brand new, 1909 to 1913; 40/- each.—Below

NEW IMPERIAL 8h.p. spindles, complete with cones, nuts and dust caps, 7/6 pair; also suitable for 8h.p. Royal Ruby.—Below.

CHAIN, ⅝×¼ Coventry, 2ft. 7in. lengths, 8/6; 22½in. lengths ½×⅛ Coventry magneto chain, 1/6 each, all above brand new.—Below.

RENOLDS chain rivet extractors, 2/6 each; listed 5/6; very useful tool.—Below.

LEATHER helmets, soft tan leather, lined chamois; special offer to clear, 4/- each.—Below.

SIDECAR C springs (Terry), 4-leaf, bushed; 17/6 pair.—Below.

ELECTRIC soldering irons, brand new, by G.E.C., 200-220 volt, listed 50/-; our price 12/-; a bargain.—Below.

SPROCKETS.—J.A.P. 6h.p. or 8h.p., ⅝×⅜, 16-tooth 3/6, 14-tooth 2/6; 12-tooth magneto sprockets, 1/6 each.—Below.

PARTS AND ACCESSORIES

ACETYLENE headlamp sets, black or nickel, comprising 6in. lamp, generator, H.B. brackets and tubing; 16/-; usual price 30/-.—Below.

MUDGUARDS, front 4in., heavily valanced and complete with stays for 26in. wheels, special clearance offer; 6/- each; worth treble.—Below.

AUTOCRAT mechanical horns, handle-bar or top tube fitting, 400 to be cleared at 9/6 each; usual price, 27/6.—Below.

KLAXONS, genuine M.C., top tube fitting; 12/6 each.—Below.

WE have a few motor cycle dynamo lighting sets these are really magnificent outfits, and were manufactured to retail at 16 guineas; we have a few sets left; our price £7/10; come and see one or write for particulars; all brand new.—Below

ELECTRIC headlamps, 7in., complete with H.B brackets and box to take accumulator, a real bargain; 35/-; these are honestly worth £3/10.—Below.

WELL-MADE metal accumulator boxes, 6in. deep by 5¼in. by 3½in., with hinged lid and bracket lugs, 2/- each; ordinary retail price, 10/6.—Below.

CYCLE Car wheels, brand new; 24×2¼, with No 2 car hub, as fitted to the Grahame-White cycle car, 10/- each; usual price 30/-.—Below.

STEEL Tubing, 1⅛×14 gauge, finest quality for M.C. work; 7d. per ft.; any length cut.—Below.

TYRE Gaiters, 26×2½, useful spare; 1/- each usual price 2/6.—Below.

TUBES, 28×3, made by Dunlop, 6/6; 26×2¼, to fit 2¼ rim, 5/9 each; 28×3 St. Helens, butt ended, 5/-; all above brand new and in perfect condition.—Below.

BELTS.—200 brand new surplus belts, 3½in. by 6ft. 6in., made by Palmer; 5/9 each; condition guaranteed; postage 9d.—Below.

BELT Punches, King Dick (genuine), 1in., brand new; our price 1/9; listed 3/6.—Below.

WATTALITE Sets.—Owners of these sets should not miss this opportunity to secure a spare driving cable complete at 17/6; only a few left; don't wait till the one in use breaks; it will be too late then.—Below.

C.A.V. contact-breakers, brand new, anti-clock 11/-; brush holders, 1/9 each; brushes, 6d. each.—Below.

BOWDEN Controls.—Brand new plated single-lever (heavy type) magneto control, complete with inner and outer cable, 5/-; double throttle control levers (black), 5/- pair.—Below.

BEST and Lloyd sight-feed lubricators, less pumps, brand new; 6/- each.—Below.

ACETYLENE burners, standard motor cycle size, taper thread, 10-litre; 4d. each, 2/6 doz.—Below.

PLUGS.—K.L.G. R.1, 2/9; Apollo No. 1, 2/9; these plugs are the goods, not aircraft surplus, which are, for motor cycles, useless.—Below.

PLEASE note, carriage on all above goods extra —Below.

ALL goods sent on approval against cash; cheques and P.O.'s should be made payable to Marble Arch Motor Exchange, 135, Edgware Rd., London, W.2. 'Phone: Padd. 789. 'Grams: Archmotex, Padd., London. Hours of business 9 a.m. to 7 p.m.; Saturdays 4 p.m. [7576

A

AVENUE Motors for all kinds of Douglas spares; we will also build you a machine and take your old one in part exchange; we guarantee you 50 m.p.g. For spares as follows:—

2¾h.p. valanced mudguards with legshields, 18/6; 2¾h.p. frames, enamelled, complete, £3/10; front forks, 15/-; wheels, £3/5 pair, soiled only; saddles, from 12/6 to 30/-; engine spares, crankshaft, 30/-; ditto races, 16/- pair; connecting rods, 15/-; tappets, 1/6; guides, 1/6; valve, 2/-; spring, 6d.; head stem, 7/6; second-hand cylinders 15/-, new 32/6; piston, 7/-; rings, 1/-; gudgeons, 1/; S.E. bushes, 1/3; B.E. bushes, 1/9 pair; valve caps, 2/6; second-hand tanks, 25/-; handle-bars, pattern, 12/-, plated; all gear box parts in stock, also 4h.p.; please sent stamp for prices not advertised; approval with pleasure; we specialise in repairs.—Avenue Motors, 373, London Rd., Thornton Heath. Tel.: 468 Croydon. [9232

TRIUMPH, Triumph, Triumph Spares.—Ward and Co.—Below.

BARREL Springs, 4/9; rear guards, 13/6; rear stands, 15/-; exhaust valves, 4/-; rear rims, 8/6; hub shells, 8/6; rear wheels, 27/6; front, 22/6.—Below.

STURMEY-ARCHER clutch sprockets, 18/-; all parts in stock, brand new, unsoiled.—Below.

The Future of the Sidecar.

PROBABLY never has the sidecar been more popular than to-day, and, furthermore, its vogue is increasing. Its development is running on parallel lines to the light car, but there is not the slightest possibility of the two lines converging into a common track. The sidecar stands in a position by itself, presenting the cheapest mode of motor travel for two or more persons.

Its universal appeal to all ages and both sexes is another striking manifestation of the sidecar's attraction. Youngsters of fourteen glory in "taking over the reins" and manipulate the controls with the ease of veterans. Men of seventy find their youth again in piling up astonishing mileages, and are candid in their preference for this sporting form of motoring to the more orthodox and staid motor car. The sidecar is sporting, cheap, and reliable; these factors are sufficient to maintain its unique position.

A reliable second-hand sidecar outfit, capable of carrying three persons, can be bought for £60, or a new machine embodying recent improvements for £100. These prices bring the sidecar within the means of thousands who only two short years ago stood aloof because of the high initial outlay. Now that prices have dropped to a level that must satisfy the most cautious, a still keener interest will be manifest in this form of travel.

The thronged highways during any week-end form evidence of the sidecar's popularity. Another pleasing feature is the enthusiasm of the devotees of the pastime. The spirit of comradeship which exists between the owners of all types of passenger outfits from the inexpensive little two-stroke outfit to the elaborate electrically equipped big twin is remarkable.

The future of the sidecar must be rosy, for thousands of none too well off family men see in it a means of realising their ambition to travel, an ambition in many cases stifled during the last nine years, but now reviving again.

Solid Tyres on Touring Machines.

THANKS to a specially designed springing system, a small runabout car is being offered to the public with solid tyres. This vehicle was exhibited at the recent Car Show and was mentioned in our article in the last issue, in which a motor cyclist's impression of the car exhibits was recorded.

Given excellent suspension and a minimum of unsprung weight, there does not appear to be any inherent objection to the arrangement except in its relation to wear and tear of the roads, which must always be greater with solid than with pneumatic tyres.

Occasionally a reader horrified by the prospect of punctures sends an enquiry as to the feasibility of fitting solid, or semi-solid (filled) tyres on a motor bicycle or sidecar outfit, and the advent of the above-mentioned machine may increase the interest in tyres which cannot be pierced. All things considered, however, the advent of solid tyred wheels on motor cycles is not likely to be yet, for the problem of sufficiently insulating such a comparatively light vehicle as even the heaviest sidecar is almost insuperable. There are those, of course, who maintain that the rather undersized covers often fitted to motor cycles and cycle cars are necessarily inflated so hard as to lose the advantage of pneumatic tyres; that this is not so is easily proved by dropping fully inflated pneumatic tyred wheels and those equipped with solid tyres from a fixed height on to the ground. The difference in the "bounce" of the former and the dead thud of the latter conveys its own story.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

BY IXION

For Emergencies Only.

THE owner of a four-valve Triumph is really angry with me. He read in this column some months ago that the Lucas acetylene head lamp of my own "Rikky" is adorned with one of Siemens' auxiliary dry battery fitments. Knowing I can do no wrong, he bought a duplicate attachment, and essayed a long cross-country at speed. Having scraped his proboscis against the tailboards of several motor lorries, he now thirsts for my blood. I protest. This auxiliary set is sold for two purposes only, and neither of them is "Rikking" at speed. The dry battery set gives an extremely modest light in the form of a long, narrow pencil of mild illumination. It is intended (*a*) to save fouling the generator during a brief spin upstreet o' nights; and (*b*) to get you home in the event of the speed lamp letting you down. This it does well. My own set has been in use for over a twelvemonth, and is not through its first battery yet. But more it will not do.

Lucas in a New Role.

THE following incident has little connection with motor cycling, but I really must drag it in. Of the lessons of the Great War, to quote various preachers and politicians, I learnt little, but at any rate I painfully and compulsorily acquired a knowledge of Morse. The other night, whilst repairing a puncture in a rural area, I distinctly recognised the Morse dash and dot in the winkings of a bright lamp on the hillside. Thinks I to myself, I will read this message. Some stranded motorist is signalling to his homestead to send the spare back axle along *toute suite*. I ransacked the aforesaid painful memories, and anon deciphered the following weird message:

"Nosey is very sorry he can't come up to-night, but he has to take his tart for a mootch."

Arriving presently outside the sending station I spotted some Boy Scouts, and forgathered with them. They were informing their scoutmaster at the local centre of their sorrowful inability to attend parade that evening; and the instrument with which their communications were performed was an electric lamp beautifully built by our old friend Lucas. But I should like to have seen "Nosey's tart"; also to have deciphered the scoutmaster's reply, which was doubtless flashed whilst I applied my patches. I wonder what my old O.C. would have said. No, on second thoughts I will not reconstruct his probable remarks on this page. By the way, was their spelling of "mootch" correct? There is no copy of Skeat's slang dictionary in the office.

"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

Dissolved Acetylene.

UNTIL we get the mass production dynamo outfit, easily transferable from one machine to another, we motor cyclists shall continue to rely on a form of lighting which has long been obsolescent upon cars; to wit, the gas lamp supplied by some form of drip generator. It is really the one and only thoroughly cheap and efficient alternative to a dynamo; and as yet dynamos are too expensive for the ordinary man, especially as they are not readily transferable to his new machine, and do not fetch their real value on the second-hand market. I use acetylene generators not only on my machines, but also for lighting a small country cottage. But for household purposes we only use them in winter. In summer they are only required for, say, an hour at the end of the day; they cannot be relighted, and are extravagant for short burning periods. This applies *a fortiori* to short runs on a motor cycle, which also suffers from smaller generators of a simpler type. This being so, I continue to be amazed at our failure to adopt the temporary solution which American riders employed almost universally until their electrical firms simplified dynamo supply. They used dissolved acetylene, and nothing else.

Elements in the Contrast.

DISSOLVED acetylene has yet to make headway over here for several reasons. In the first place, it has still to be pushed. It appears annually at the Show, where innumerable riders study it, are attracted, and take home leaflets. They then discover that their local garage will not stock replacement cylinders except under heavy pressure. They find that the stuff is on the dear side, as must always be the case where output is small, and organisation fragmentary. If their machines are small, they realise it may be awkward to accommodate the somewhat bulky apparatus anywhere on the frame. Between America's cheap, pleasant riding in its pre-dynamo period, and our own makeshift methods with generators, there is only one petty difference in the technical factors, viz., that the average American rides a big twin, which has lots of power and space. Nevertheless, I have always been convinced that dissolved acetylene (which I have repeatedly used in spite of all the difficulties) could be a great boon to us. If I were secretary of one of the big, live northern clubs, I should try to organise.

Occasional Comments.—

a band of D.A. users among my membership, so as to solve the local problem of spare cylinder stocks. I believe the fashion might spread like wildfire. The present drip generator is unquestionably excellent on long runs in practised hands. It is fundamentally ill-suited for short spins, and it can give an unaccustomed user quite a lot of trouble.

Wanted, an Instrument Board.

BEFORE long, motor bicycles *de luxe* will certainly be sold complete with instrument boards. For many years past there has only been one indispensable instrument, the speedometer; it enables you to test tune, to verify the effect of each adjustment singly, to check your running costs, and to shatter that awkward incubus, your conscience (for you cannot hold your own when speed is discussed unless you either have no speedometer or frankly determine to let the best liar in). But to-day there are three essential dials. The speedometer is one; the ammeter is another—if you have a dynamo; and the Tapley gradometer is a third. The latter is quite as essential for verifying tune as a speedometer, and adds a treble interest to all runs in unknown country, and also to runs in country which you have not previously tapleyed. Now one can, of course, mount the Cowey, the Tapley, and the ammeter as three naked excrescences. In this case they make your machine look like a warthog. They demand incessant cleaning, owing to the hosts of plated crannies thus exposed. And the speedometer upsets your steering unless you either mount it on the top tube *à l'Indienne*, or balance it by bolting a fat mechorn to the other side of the bar. As soon as my 1923 machine comes along I must get busy with some sheet aluminium and mount all my dials on a proper facia board.

IN GLENCOE—the Glen of Weeping. The curving road shown is the beginning of the newly-made route from Bridge of Coe to Kinlochleven, which embraces wild country, described by Dickens as "fearful in its grandeur and amazing solitude."

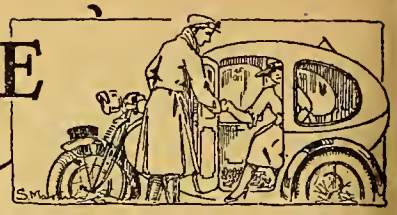
About Knee Grips.

KNOWING that I should be earning some overtime pay at the Show, I gave a lordly order to my garage to fit knee grips to my pet 'bus. Just "knee grips." I didn't specify size or make or price. Then I went for a ride. The garage probably felt dubious about their bill, and elected to cut their loss. Anyhow, they fitted the tiniest knee grips I have ever seen. Secured by single ½in. straps to the tank. On the road I sometimes found these knee grips trying to work off the tail of the tank, and at other times exploring its forward end to test the effect of oil leaks on their indiarubber. At any rate they never stayed under my knees for more than half-a-mile at a time. Next time I want knee grips I shall specify some with two broad straps, which will "stay put."

In the Hands of a Liquidator.

TROUBLOUS times have put several excellent businesses in the hands of liquidators during the last four years. In several cases manufacture has been continued, and the machines have been advertised at very tempting prices. Riders from all over the country continually ask my advice as to the purchase of machines built under such conditions. The answer suggested by the facts is fairly obvious. In most cases financial difficulties have not originated through any technical fault in the machine. In such cases it will be entirely roadworthy. If it has been manufactured in considerable numbers it will always be worth somebody's while to maintain a supply of spare parts; the patterns will not be destroyed even if manufacture ultimately ceases. On the other hand a receiver is plainly inferior to a prosperous manufacturer in one main respect. He may not deal so generously with a customer who has had bad luck with a new machine.

PASSENGER MACHINE TOPICS



by "Friar John"

What will Olympia Reveal? From Fishing to Fleet Street. Things Found on the Road.

NO one can ascertain at the moment what type of sidecar will be most popular at the Show. Interest will, of course, be fairly divided between both the big and little outfits. But I shall be interested to observe the attention given to the super-sidecars, that class that is on its last legs, and standing with one foot in the grave, according to various scribes and others who ought to know better than to prophesy.

Of course the scrutiny given to Olympia exhibits is often misleading, and big crowds do not denote big sales. The primrose coupé on the F.N. last year, and the Harley de luxe coupé ensnared the feminine visitors by the hundred, but there were precious few coupés on the road last year. But superficial visitors won't deceive the experienced and observing heads of firms. Two Show days will be sufficient to tell them which way the wind is blowing, and the makers of outfits costing anything over £140 will have felt whether the wind is balmy or has a knife edge. I hope it will be a sirocco from spice-scented, sun-kissed isles.

THE OLD OAK AT BAGINGTON which marks one of the several "centres" of England. Quite an interesting afternoon's run is to visit the various reputed centres round about Leamington and Coventry.

MORE than one sagacious maker thinks there is a lot to be said for "round figures." Personally I agree, for I know a lot would be said if there were a few more round figures on the balance in my pass book. I refer, however, to the price of an outfit. The round figure is, of course, £100. Many men will go to the Show prepared to spend that amount, and the same old few will be there also who order a *de luxe* sidecar, then write and cancel it when freed from the intoxicating atmosphere of those enchanted aisles. But the firm giving the best value in outfits round about £100 will get a fat book of orders.

ON a recent warmish afternoon I spent an hour or two spinning for jack. It is really a wicked thing to do in early November. But that is what the sidecar does for you. It is such an easy thing to throw rod and tackle in the sidecar and run down to your favourite haunt. It made a destination on an open afternoon, and I am no golf fanatic.

The net result was one fierce-looking little wolf of about 3 lbs. But the waters are not clear of rubbish yet; not until we get some weed-killing frost can the silvery spoon be cast across the black waters and reeled in free from green "flannel."

It is a very sorry tale compared with a sidecar run in 1912, when the catch covered thickly the bottom of an old wicker sidecar, so thickly indeed that one of the pike slipped underneath the cover at the toe and was left on the road—a strange thing for someone to pick up in the highway, a 6 lb. pike, but not the strangest thing picked up on the road by any means. In my sidecar seat at the present moment is a rubber hot-water bottle to which is tied two baby's comforters. This was found on the road near Barnet. Why it was not cast away I don't know. Another queer thing I picked up years ago was a bundle of love letters written by a passionate Don Juan to a pinnacle of ice apparently. My companion in the sidecar held no ideals; he—or was it she—spent an amusing ten minutes with them, I well remember.

I COME back with a bump to London, E.C. It is a murky day, and through the murk I see two or three Enfield sidecars flash by laden with evening papers. (What a contrast from the crystal air of a bright January day and a sidecar laden with pike!) Those sidecars have been stationed for an hour or so outside a printing house, the drivers waiting to receive the first bundles straight from the press. This goes on every day, week after week, with the same machines, midst the same rush and scurry. Hard usage and heavy weights are their lot. But they run splendidly, and appear to revel in an occasional collision, so long as it doesn't

Passenger Machine Topics.—

do more than knock the sidecar mudguard off or smash the lamps.

◈ ◈ ◈ ◈

THE *Autocar* was a weighty feature of Smith's bookstall last week, and no wonder, for every copy weighed nearly 2 lbs., and contained 350 pages, all for 4d. In it there was contained everything the light car man wanted to know about all the little four-wheelers.

◈ ◈ ◈ ◈

I WONDER if all owners part with their mounts with the same curious reluctance one associates with the parting of animate things. Two acquaintances came last week and dragged my outfit from its snug home in the garage. One of them carelessly banged open the throttle, and, with an unfeeling and muscular dig, endeavoured to set the works in motion. Of course the machine refused to fire, as was only natural. After irritating the float he again kicked furiously, but nothing happened. He again waggled the lever and heaved mightily. This time he broke her spirit. She fired. Then the gears —gr-grrrrr. I turned sadly away.

A few days afterwards I told a colleague of my tender, lacerated feelings as I stood with clenched hands (gripping the cheque) watching the departure of a faithful mount.

He looked at me a few seconds in silence, then said he sympathised with me deeply, for he himself had become so attached to his sidecar that he had decided to keep it next year, and probably for a long, long time, simply because he dare not face the pangs of grief in parting with so dear a thing. He turned slowly away muttering.

◈ ◈ ◈ ◈

SHALL we soon be seeing pater scuttling away on a motorised bicycle, his family being left to practise economy by going for a walk in the country instead of being packed in the sidecar? Week by week we hear of innovations in this class of vehicle.

Some of these little machines are decidedly attractive at the price asked for them. The Rolls-Royce individual buys a light car as a tender; why not a motorised bicycle as a tender to the big sidecar? I know one owner who is contemplating the purchase of a miniature, but underground influence is at work in his case. His daughter is thirteen years and ten months old.

The Smallest Practical Sidecar

Machines of 250–350 c.c. for Passenger Work.

Economical Transport for Two.

Sidecar outfits of 350 c.c. capacity have demonstrated wonderful hill-climbing ability. (Above) A side-valve four-stroke shows its paces. (Below) No audience applauds this sleeve-valved engine's ascent of a Scottish hill.

JUST as the cubic capacity of the popular touring solo mount has been gradually decreasing in size, so also has it been found practicable to decrease the engine capacity of passenger-carrying vehicles.

In pre-war days one was apt to consider that the attachment of a sidecar to any engine of less than 500 c.c. partook of the nature of cruelty to small engines. Even the use of the 500 c.c. engine for this purpose was criticised quite severely by many people, though there were not a few smaller sidecar outfits.

Now, however, 350 c.c. (and even smaller) outfits are quite common objects, and many who have undertaken long tours with machines of this size consider that no larger engine is required for normal work.

A Word of Warning.

Though this is true to a very large degree, a word of warning should be issued to new owners of motor cycles in that it is unwise to buy a small solo mount and thereafter attach to it even an ultra light sidecar without first consulting the manufacturers. One has only to consider that even a perfectly aligned sidecar imposes a considerable drag on the chain stays and down tube of a motor cycle to realise that a frame designed entirely for solo work is quite unsuitable for double transport. In addition to this, bumpy roads impose a very considerable twisting action on the parts mentioned.

Again in anything but the flattest country a three-speed gear with a fairly low emergency ratio is desirable unless the engine pulls particularly well at low speeds as is the case with many two-strokes.

Both two- and four-stroke engines of considerably less capacity can and do pull a light sidecar satisfactorily, as may be proved by the performance of several 250 c.c. machines on the track and in open competition. At the present moment, however, the majority of really small engines which are set the task of conveying an extra passenger in any form of wheeled attachment are of the two-stroke type; probably because this form of engine is capable of developing a considerable amount of power at low speeds and will "slog" along patiently up long hills, even when it appears to have reached its last gasp.

There are too many lightweight sidecars now before the public for us to give a list of every make available, but amongst the two-strokes the Connaught, Ivy, Calthorpe, Sirrah, Velocette, Levis, and Allon should be numbered as pioneers in this line, while more recently the Villiers Co. has produced a 350 c.c. engine largely with the idea of providing a suitable power unit for such work.

Speed of Four-stroke Outfits.

The case with four-strokes is somewhat similar. One of the most prominent performances in speed events during the past competition season has been the 250 c.c. Francis-Barnett, and 350 c.c. A.J.S. and New Imperial models with suitable sidecars are listed in the manufacturers' catalogues.

The makers of such machines as the Sparkbrook, Radco, Raleigh, Royal Ruby, and many others have successfully applied a passenger attachment to lightweight machines, and one cannot help feeling that

The Smallest Practical Sidecar.—

there is a large future for any form of transport for two which can be bought and maintained at such moderate figures as the modern lightweight and sidecar.

The average motor cyclist whose touring is confined to week-end outings, and perhaps a fortnight's holiday in the year, does not require a machine which will climb mountains, and will be perfectly content to take his passenger over main, or at any rate reasonable, roads. The climbing capacities of the modern machine are such that the touring ground for this class of rider is unlimited, except in a few well-known corners of the country. Should outstanding examples of hill-climbing capabilities be required, the performance of the little Hawker two-stroke on Applecross in the 1921 Scottish Trials and the repeated ascents of the Old Wyche at Malvern by an Ivy sidecar may be instanced. Then there are G. Denley's many fine mountaineering feats on the Velocette outfit, Litton Slade and Bwlch-y-Groes being perhaps the chief; or S. M. Greening's (Francis Barnett) and L. A. Walsh's (O.K.) ascents of Alms Hill.

Apart from this, there should be a great future for such machines in the hands of ladies who live perhaps five or ten miles from a first-class shopping centre. In this case the light weight and ease of starting and handling of a small sidecar outfit have great advantages.

On the Track.

Regarding the speed capabilities of the light sidecar outfit, C. G. Pullin has attained 71.83 m.p.h. on a 346 c.c. Douglas over a kilometre, and has maintained 41.76 m.p.h. for 24 hours.

Concerning the maintenance of small outfits, there is little to be said. Low gears, and, in the case of two-strokes and flat twins, even torque, save wear on transmission and tyres. It is advisable to spend ten minutes every now and then in making certain that all nuts and sidecar fixings are well screwed home, and the sidecar should be periodically checked for alignment, since a very small error in this direction will produce a noticeable decrease in the performance of a small engine, and will affect power and fuel consumption to a marked degree.

One cannot expect to be able to overload really small outfits with hoods and the thousand and one fitments so dear to the heart of a certain type of motor cyclist, but as regards practical accommodation and comfort there need be nothing lacking, and all necessary spares can be carried with ease in the lockers usually provided.

In some of the most important reliability trials, small two-stroke outfits with engines of 350 c.c. capacity or less have performed like the 500 c.c. four-strokes of pre-war days.

So wonderful have been the performances of tiny engines that one wonders how long it will be before a passenger attachment is produced for the latest ultra lightweight motor cycles of approximately 150 c.c. In the present stage of the industry such a move would be most undesirable, though in a year or two's time it is very possible that some light attachment may prove a success for short distance work even in conjunction with such tiny engines.

Selection Hints.

A word of advice to those considering the purchase of a small sidecar outfit. Select a sturdily built machine, the makers of which are prepared to recommend it for sidecar use. If it is proposed to undertake long distance touring, specify a three-speed gear, and by all means select final chain drive. Final belt transmission answers satisfactorily, but requires periodic attention in wet weather, since the big reduction both in primary and secondary drives is apt to produce a low speed belt running over pulleys of widely varying diameter, two features which are not altogether desirable for passenger work. Very few of the miniature outfits of to-day, however, are offered in the belt-driven form, and this advice applies mainly to those who buy on the second-hand market, which is not a very wise procedure in this particular case.

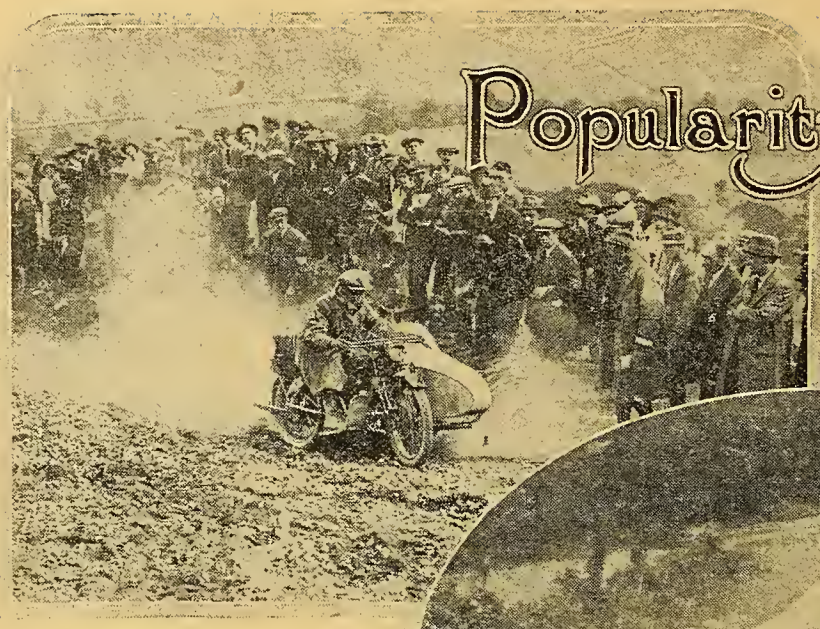
As regards tyres there should be no difficulty, for the majority of such machines are fitted with 26 × 2¼in. rims on which 2⅜in. or even 2½in. tyres may be fitted according to taste. It is not desirable, however, to over-tyre the smaller of these small outfits, since the additional weight and road resistance are more noticeable with an engine of approximately 250 c.c. than with an outfit of normal capacity.

In the case of a rider whose means limit him to a two-speed machine, he need have no fear that his machine will be unsatisfactory under any normal conditions, if he chooses wisely from the products of the best-known manufacturers.

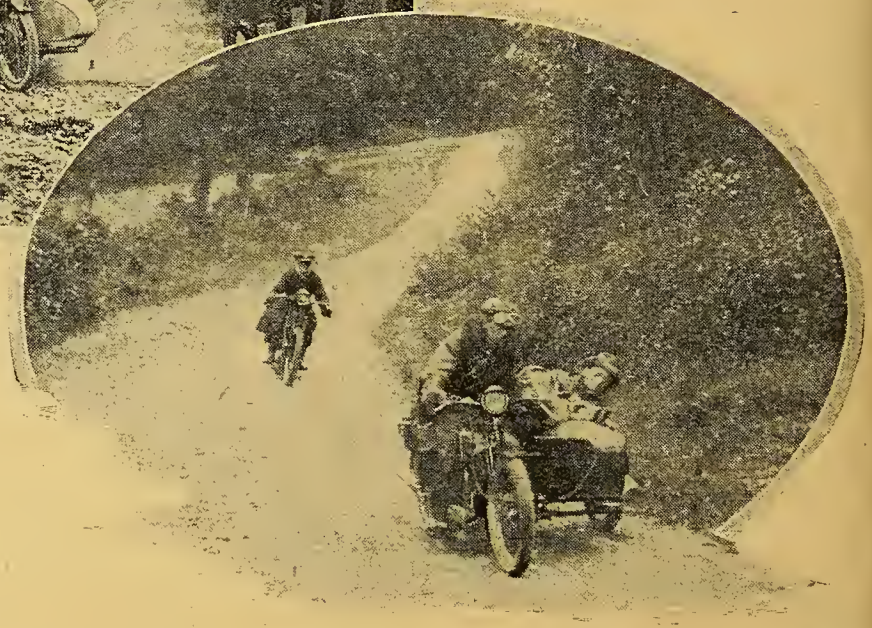
Whatever the choice of the prospective owner, he should very definitely stipulate for a clutch and kick-starter, for there are comparatively few motor cyclists who are sufficiently young and energetic to put up with a push start (with a passenger normally seated) more than once or twice a day.

The upkeep of a small sidecar outfit is miraculously low, if the machine be a good one; fuel consumption of from 70 to 100 miles a gallon may be expected, and tyres should last for 4,000-5,000 miles even on the rear wheel—at least a season's running for the average buyer of this type.

Popularity Bred by Efficiency



In trials, touring, or hill-climbing, the ubiquitous single-cylinder sidecar easily holds its own.



Always the Passenger Machine of the Masses, the 500 c.c.—650 c.c. Single Cylinder Sidecar has had a Long and Worthy Development.

THERE is one type of passenger machine which has no rival on the road; it is the economical 500-650 c.c. sidecar with the motor cycle of the dual-purpose type.

The medium-weight sidecar does, and will continue to, meet an enormous demand, and so long as we have solo motor cycles just so long will the owners of these desire at times to carry a passenger in a sheltered and comfortable position.

How Solo Sizes Increased.

At one time most solo enthusiasts blessed, or rather cursed, this tendency. The public appreciation of the sidecar attachment was so great that manufacturers, anxious to concentrate upon one, and that the most serviceable model, could not lose sight of the sidecar. They realised that whatever their own views were, a very large percentage of their customers were going to attach sidecars to their machines. Therefore, there was nothing for it but to add weight, to increase cubic capacity, and to amend compression ratios and valve settings for the hard slogging conditions imposed. Thus the soloist found his favourite make developing cart-horse features, which were heart-breaking to contemplate; and a large number of men turned to overseas productions for relief of the situation.

That order also is gone. To-day no one is better catered for than the soloist. Every factory with any following has its essentially solo machines, but it has also its dual-purpose machine.

Vogue of Dual Purpose Models.

The popularity of the latter has remained unaffected throughout all the undulations of recent years. A little heavier than the sports model type, it is not too heavy to be used solo by the man who represents the masses. He does not want super-speed, though naturally he desires to be able to maintain good averages. With the dual-purpose mount he can pile on what accessories he likes without detracting from its distinctive merits; he can fit a sidecar and carry a passenger, knowing that his cost of upkeep will remain as nearly the same as makes no difference, and that, except on winter roads and against head winds, his machine will be only a little slower than it is when ridden solo. It is a type which, for general usefulness, is unrivalled. Sidecars can be attached to lightweights, but not without detracting considerably from their speed and climbing powers, while from the point of view of the majority, the average big twin sidecar machine is not a desirable solo mount.

So, as a popular type, the dual-purpose mount is

Popularity Bred by Efficiency.—
firmly established, and this being so the purchaser of such a machine is safe in concluding that his depreciation will be as low as can be expected. In initial cost, as in upkeep, the 500-650 c.c. mount is as cheap as anything that can be bought, taking its speed, hill-climbing, and general utility into account. It is probably the most reliable mechanically-propelled vehicle on the road; it affords all but the cheapest travelling for one, and certainly the cheapest travelling for two, especially if a fair amount of luggage has to be carried.

Utility Duties.

For the country tradesman who does his delivery by sidecar, but who desires occasionally to use his machine solo, or to fit a passenger-carrying body for his wife; for the civil servant who covers a great mileage during the week unaccompanied, but who wants to take his wife and family out during the week-end; for the rider who is one of thousands desiring a certain amount of speed but at no sacrifice of reliability, and who wants a machine which he can ride and keep on riding with a minimum of attention—that is, a machine which will maintain its tune—the 500-650 c.c. type stands unrivalled. And well, indeed, it might be.

For years past the trade has concentrated, by gradual stages, upon its production. It is not an invention; it is an evolution. No type is so much the outcome of close practical research and road test.

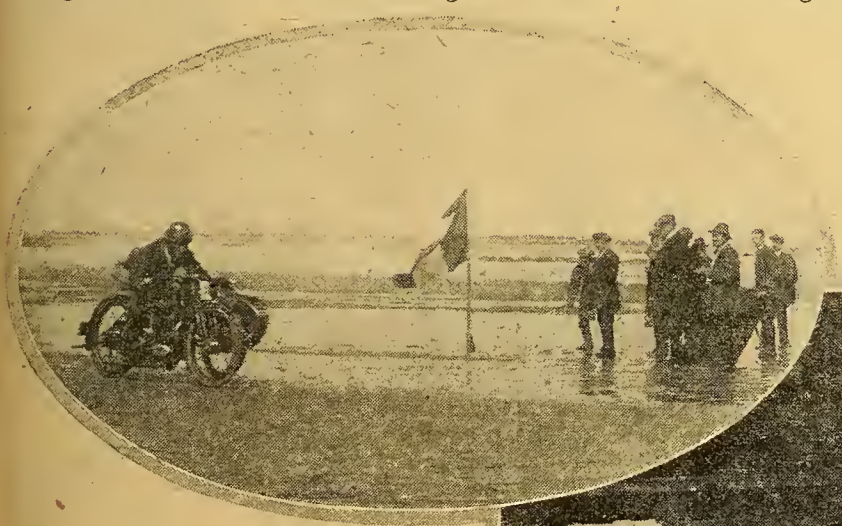
To get down to bedrock facts concerning the medium-weight outfit, one or two observations based on practical experience may be of value. It has been said that the type affords the cheapest travelling for two, and this, taken the year round, is unquestionably so. Brief experience of the big powered outfit and the medium-weight, may lead one to think that there is very little difference between the two in cost of upkeep, but there is this difference. There may be periods when adverse conditions bring the general upkeep cost of the big twin outfit to double what it is normally. In the case of the smaller machine, however, the variance under the same conditions is not so great. These circumstances, it is only fair to say, are rare, and only arise in the event of, say, the breakdown of some important engine component; nevertheless, they are to be considered by those who can "only just afford it," and it is for this reason that the alternative mount remains essentially the poor man's machine.

There is, in addition, of course, the question of initial cost, which, since it runs hand-in-hand with depreciation, is a very important item. Tyres, chains, insurance, taxation are in every case a little heavier with the big machine than with the lighter one. The same, of course, applies to the type of vehicle which it is said might supersede the 1,000 c.c. sidecar.

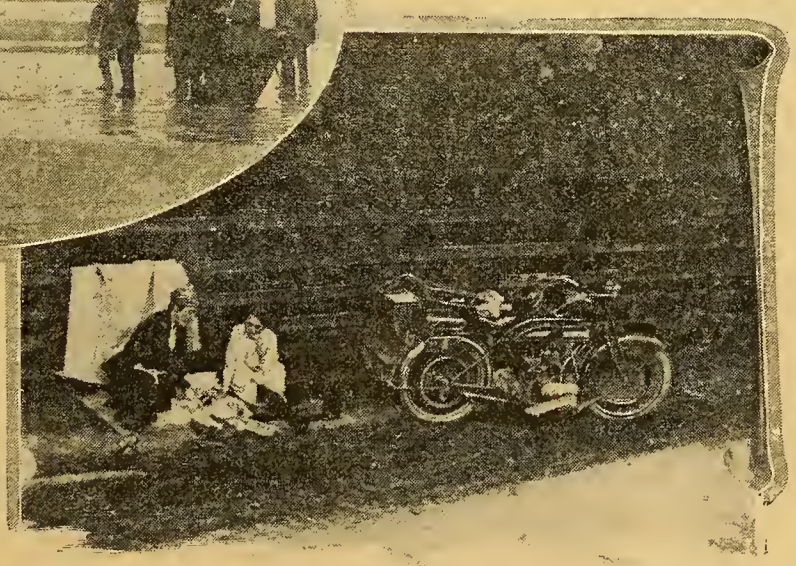
Over-all Economy.

If the big outfit should go, it could only be a case of one type slowly superseding another rather than of annihilation. The big outfit has established as great a host of devotees as the dual-purpose medium-powered models, but it is only the latter which has entirely escaped questions as to its permanency; there is no question but that it is as firmly established as the solo machine, for it represents over-all economy for the thrifty man in the street who can afford to sink a little more capital than the lightweight buyer.

The foregoing is, then, written with a view to emphasising the fact that, whatever changes take place, whatever developments may be realised affecting those who desire always to carry a passenger or the equivalent thereto, the dual-purpose mount will remain a permanency.



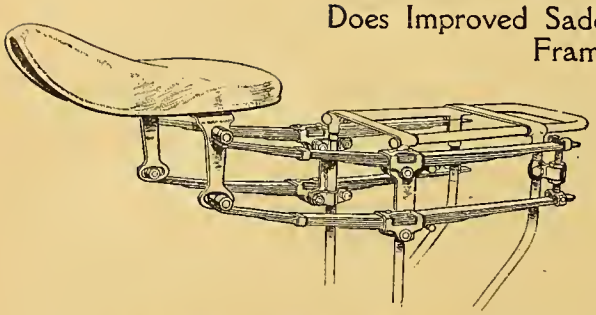
A single-cylinder sidecar machine as a racing mount.



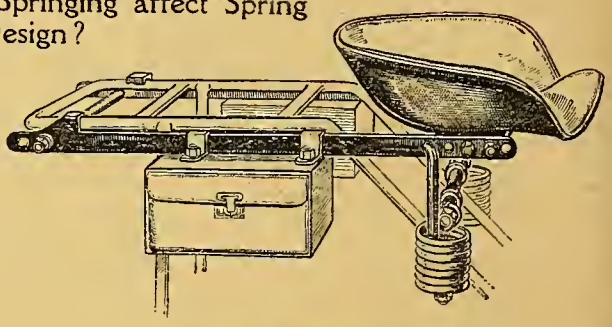
No type of machine offers greater power in proportion to its initial cost than the medium-weight big single. It will transport three people and the impedimenta of picnic or tour with the greatest ease.

SADDLE COMFORT.

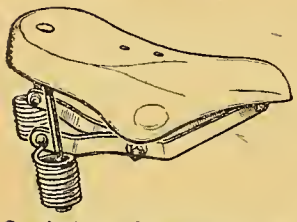
Does Improved Saddle Springing affect Spring Frame Design?



Brooks cantilever, a seat famed for its comfort.



X.L.-All model made for the Ner-a-car.



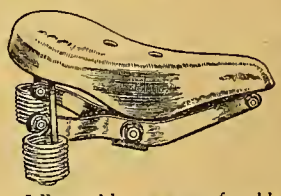
Standard model produced by the The Leatheries Ltd.

A SADDLE can make or mar the pleasures of a motor cycle. All experienced motor cyclists have at one time or another had occasion to grumble at particular saddles, and they can praise with equal fervour certain saddles which have been a pleasure to use.

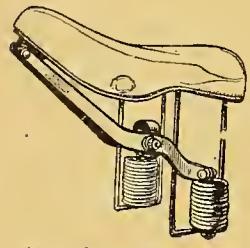
A few years ago luxurious saddles were scarce, even tolerably comfortable models were in the minority, but to-day it is a man's own fault if he rides a yard on a saddle that does not suit him. He can ride in luxurious ease on such designs as the Brooks cantilever, the Tan-Sad, the Terry, or the XL-All.

One of the latter designs has even advanced so far as to introduce ball bearings.

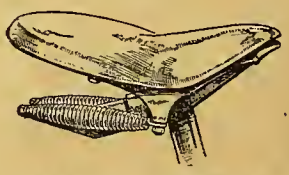
The Terry seat, too, is particularly original in that it embodies scientifically arranged coil springs in its construction, giving a comfort that must be experienced to be thoroughly appreciated.



The Jelley, with waterproof rubber top in place of leather.



A popular Lycett model.



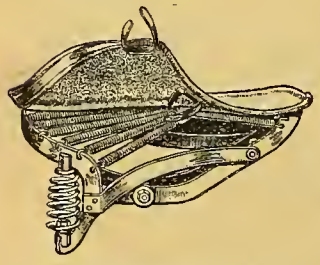
X.L.—All sporting lightweight model.

The Result of Progress.

So closely is the question of saddle springing and suspension being studied to-day, and so effective are some of the designs produced, that this may account for the apparent indifference displayed by many motor cycle makers towards rear springing. After all, if a finely-designed system of saddle springing can give the rider an immunity from road vibration comparable to that offered by a spring frame, then it is doubtful if the extra complication of the latter is justifiable on the lighter and simpler type of machine.

On a solo mount neither a spring frame nor a saddle must permit too much side play, but on a sidecar outfit the same considerations do not obtain, and full use of long, supple leaf springs may be made.

Racing Brooks model employing leaf springs.



A seat of springs—the Terry.

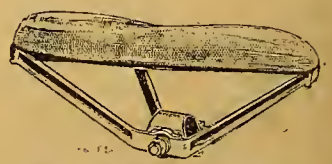
The Tan-Sad is mounted cantilever fashion.

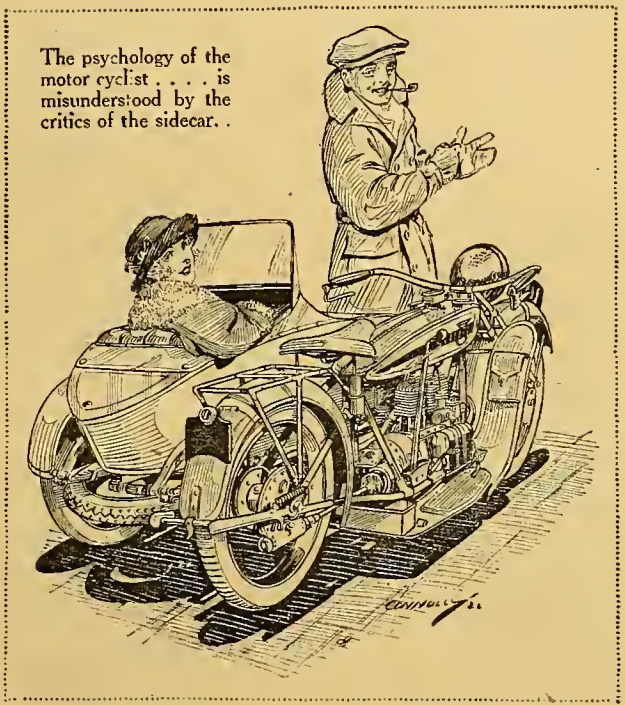


Simple and strong Austin saddle.

Why the High-powered Sidecar Outfit is not Menaced by the Advent of the Cheap Light Car.

At the Top of its Class

Price Margin between the Two Types as Wide as Ever. First Cost not the Total Cost.



The psychology of the motor cyclist . . . . is misunderstood by the critics of the sidecar. .

MERELY because small cars are cheaper this year, the old, old subject "sidecar or light car" is again a topic raising heated arguments as to whether the former will finally succumb to the attack of the latter.

As usual, 1923 car prices are compared with 1922 sidecar figures, and once more the old contentions against the popular outfit are cited as reasons why it is doomed; but the strange feature of this controversy is that very few sidecar owners are to be found among the critics.

We are not at the moment concerned with the extreme and absurd view that the sidecar in all its forms may ultimately be replaced by a light four-wheeler, but rather with the present position and the justification of the fully developed sidecar outfit—the machine which is at the top of its class and which, we are told, is in danger of extinction *because small cars have been reduced in price.*

One point overlooked is that 1923 prices of sidecars, too, are considerably below those of 1922.

Even Manufacturers Doubt.

Motor cyclists resent the implication that the cheapest small car is a better article than the most expensive sidecar. This seems to be the idea of all who expect a revolution in economical motoring next year. Even certain manufacturers have been caught in this offensive on the part of those interested in the production of cheap four-wheelers, and those who enjoy the confidence of sidecar makers are told that 1922 has been a bad year for big sidecars and that a light car proposition is being considered to take their place.

If the sale of big sidecars has really fallen off during the past year, *there is no proof that these sidecars would have sold in greater numbers had there been no light cars.*

Even if 1923 is a good year for small cars and a bad year for big sidecars, evidence is still lacking to show that the purchasers of the former would otherwise have bought the latter. Undoubtedly there is a big field for small cars at a low price, but the majority of buyers are those who have not been attracted by the sidecar and have waited for the cheap four-wheeler. Certain it is the average big sidecar owner is not as a rule a man who has been waiting for something which may cost more than his sidecar, but may easily be inferior in quality and performance. Very few owners who are at the top of one class are likely to be influenced to purchase something which places them at the bottom of another.

Every year sees a number of motor cyclists joining the ranks of car owners—it is only a natural sequence. But seldom do we see the owner of a *de luxe* outfit selling it to buy the cheapest form of four-wheeler. He requires a car of which he can be as proud as he was of his sidecar, and more often than not such a vehicle costs double the price of the most elaborate sidecar.

One had only to visit the Car Show last week to realise that the majority of those interested in the new light cars are not motor cyclists nor people ever likely to become motor cyclists. The few motor cyclists who inspected the array at the White City and Olympia were instantly recognised by the questions they asked—embarrassing questions to the average stand salesman. No owner of a sidecar first tried the cushion springs; he required to know something of the mechanical elements. On the other hand, the potential buyers of cheap small cars revealed their novitiate stage by ignoring altogether the essential features of the vehicle.

Where the Critics Err.

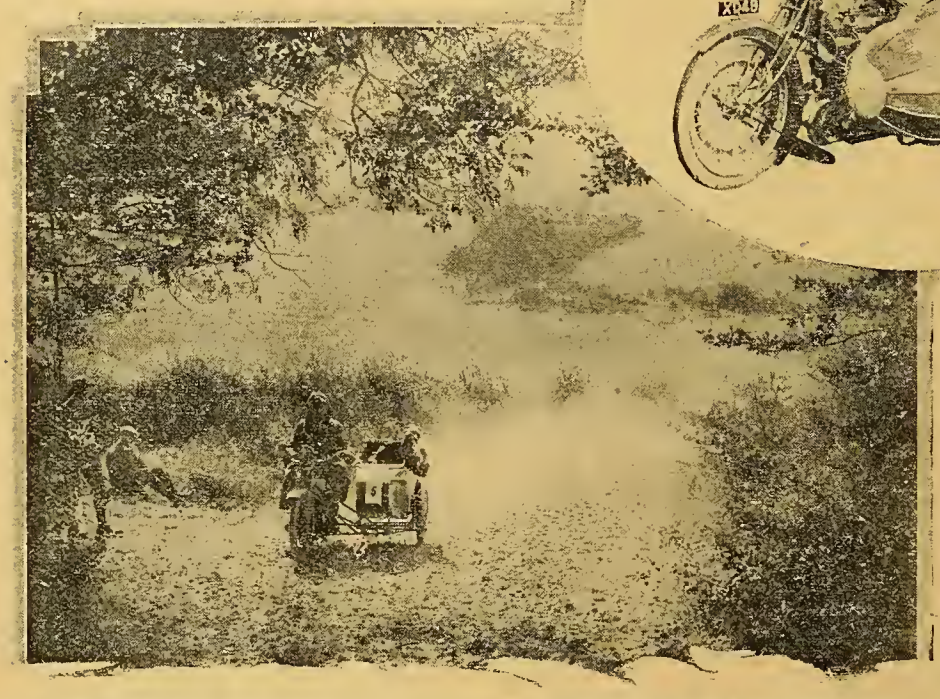
The psychology of the motor cyclist is one of the chief items misunderstood by the critics of the sidecar, who, by the way, are usually those who have never used sidecars, are not interested in their manufacture, and do not know the people who use them.

At the Top of its Class.—

If it were true, as they think it is, that all sidecarists consider anything on four wheels superior to their own machines, the big sidecar outfit would have disappeared long ago. In 1912 there were many cycle cars offering, it was claimed, "all the pleasures of a car at the cost of motor cycling," and it is true that they were offered at remarkably low prices, as the following price list of the period will show :—

Humberette ...	£125	A.C.	£65
Swift	£136 10s.	Morris Oxford ...	£175
G.W.K. ...	£150	Calthorpe	£168
Crouch	£132 15s.	Singer	£185
J.B.S.	£127	Baby Peugeot ...	£160

The big twin sidecar at that date was only in the embryo stage owing to its hub gear. In fact, one may say that the big sidecar outfit has been developed since 1913, and, therefore, in spite of the cheap light cars then on the market. If the arguments against the sidecar and the light car hold good to-day, they doubly applied ten years ago, when the big sidecar was a doubtful proposition and the majority of small cars followed large car practice.



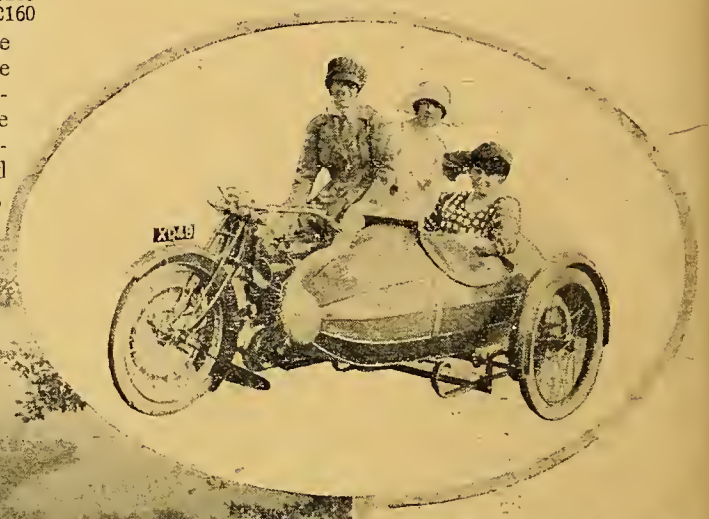
In hill climbing the big sidecar has an advantage over the small light car by the wider ratio of weight and power.

The 1923 small cars offered at prices which are supposed to compete with those of sidecar outfits are, after all, not so numerous, as the following list will confirm, for all best known small cars under £200 are included :—

Bleriot Whippet, 2 cyl., A.C., chain drive	£155
Buckingham, 2 cyl., A.C., shaft drive	£185
Tamplin, 2 cyl., A.C., chain drive	£150
Trojan, 2 cyl., W.C., 2-stroke, chain drive, solid tyres	£175
Unit, 4 cyl., W.C., friction and chain drive ...	£185 17s.
Stoneleigh, 2 cyl., A.C., shaft drive	£185
Rover, 2 cyl., A.C., shaft drive	£180
Mathis, 4 cyl., W.C., shaft drive	£197
Lea-Francis, 2 cyl., oil cooled, shaft drive	£190

One fact cannot be refuted. The sidecar has proved itself to be a mechanically sound proposition eminently suitable for the people who use it. It is economical, and costs much less in garaging, taxation and insurance than any four-wheeler. When replacements are necessary they are usually to be obtained at a moderate price because they are small items.

Even if prices, taxation, insurance and garaging costs were equal, the possibility of replacements has to be considered. If various parts are taken separately and in conjunction with the items approximating to them in a small car, it will be seen that those who motor on the small margin between necessities and total incomes have good reason to be satisfied with the sidecar, especially as it is logic to suppose that the more one pays for an outfit, the less possibility there is of having to meet a repairs bill, while the reverse is the case with the cheapest form of small car, built down to a price.



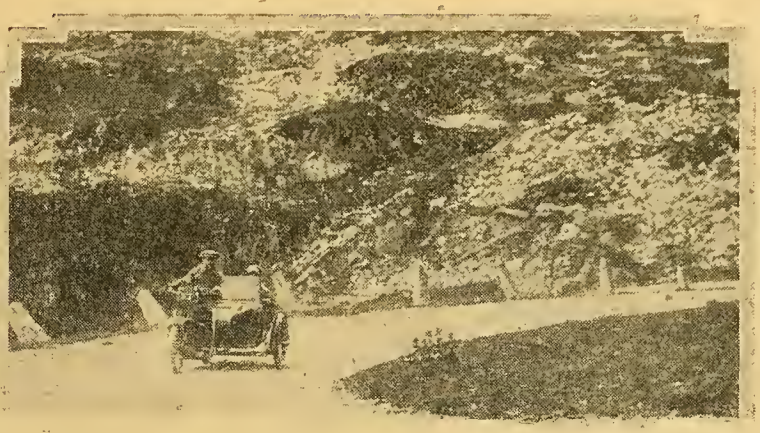
Whatever the critics may say, the fully equipped sidecar is a machine of which to be proud. It is easy to handle and keep in order.

Those with slender purses should try to imagine the difference between removing an engine or gear box on a motor cycle and dismantling the same units belonging to a car. Let him also visualise the task of decarbonising a twin-cylinder motor cycle engine and the same necessary proceeding with a *monobloc* four-cylinder car engine; let him enquire the cost of having this work carried out at the local garage, and the prices of a new back axle for sidecar and car respectively.

But, say some of the critics, with a sidecar one has all the units and material with which to make a cycle car. Why not re-distribute the material and drive from a seat instead of from a saddle? This

At the Top of its Class.—has been done in two notable cases, *i.e.*, the Scott Sociable and the Seal, but they still remain vehicles quite distinct from the cycle car and the light car.

This same question was asked by the present writer ten years ago, and he has seen it answered, not by words, but by actual experience. This is the very thing which was attempted by the makers of the early cycle cars, which were not only mechanically unsound, but as a commercial proposition were a dismal failure.



The owner of a cheap four-wheeler would hesitate before undertaking a tour of the Alps, yet the big sidecars—and smaller machines too—have proved themselves eminently suitable for tackling the long and severe grades encountered in Switzerland.

In 1912 a certain manufacturer of motor cycles produced a cycle car employing motor cycle practice in a vehicle which in appearance was a small car. The chief reasons for its disappearance were (1) it could not be produced at the hundred guineas at which it was offered, and (2) since it employed a motor cycle type of engine and chain transmission, enclosed in a metal body, it was noisy. This engine and gear box were embodied in a big twin sidecar outfit which showed its maker a handsome profit at a price 20 per cent. below the price of the cycle car. What is more, there was a ready demand for the sidecar and practically none for the four-wheeler.

All prices for 1923 big sidecars have not yet been announced, but the following suffice at once to refute the idea that they are in competition with those of cheap four-wheelers. As will be seen, there is still approximately a £50 margin :—

Harley-Davidson	£139 15s.	American X. ...	£131 5s.
Matchless ...	£130*	A.J.S.	£152 10s.
Excelsior ...	£123*	Dot.	£130*
F.N.	£140*	Martinsyde ...	£130*

* Electric equipment extra.

Even if prices were equal, the big sidecar could not be compared with the small car which usually has an engine of the same size or smaller. The power-weight ratio is so much in favour of the sidecar that its speed places it at a great advantage. If speed and carrying capacity be the point of comparison, then the new light cars at prices below £200 should be compared with the smaller types of sidecars which for 1923 will be at a figure in the neighbourhood of £100.

To summarise, 1923 sees practically no change in the respective positions of the big sidecar outfit and the light car, nor can there be so long as the extras for taxation, garaging and professional repairs alone in the case of the four-wheeler add an additional penny per mile on the average full year's motoring.

And extras for these items do not complete the bill; only motor cyclists who have toured on a car know the many extras one is expected to pay at hotels, ferries, garages, etc., merely because one is using a car.

There is one other item often overlooked by those who have land adjoining their houses upon which they can build a garage; frequently one hears the statement that, as they contemplate building a garage, the cost of housing their machines is nil.

Garaging at Home.

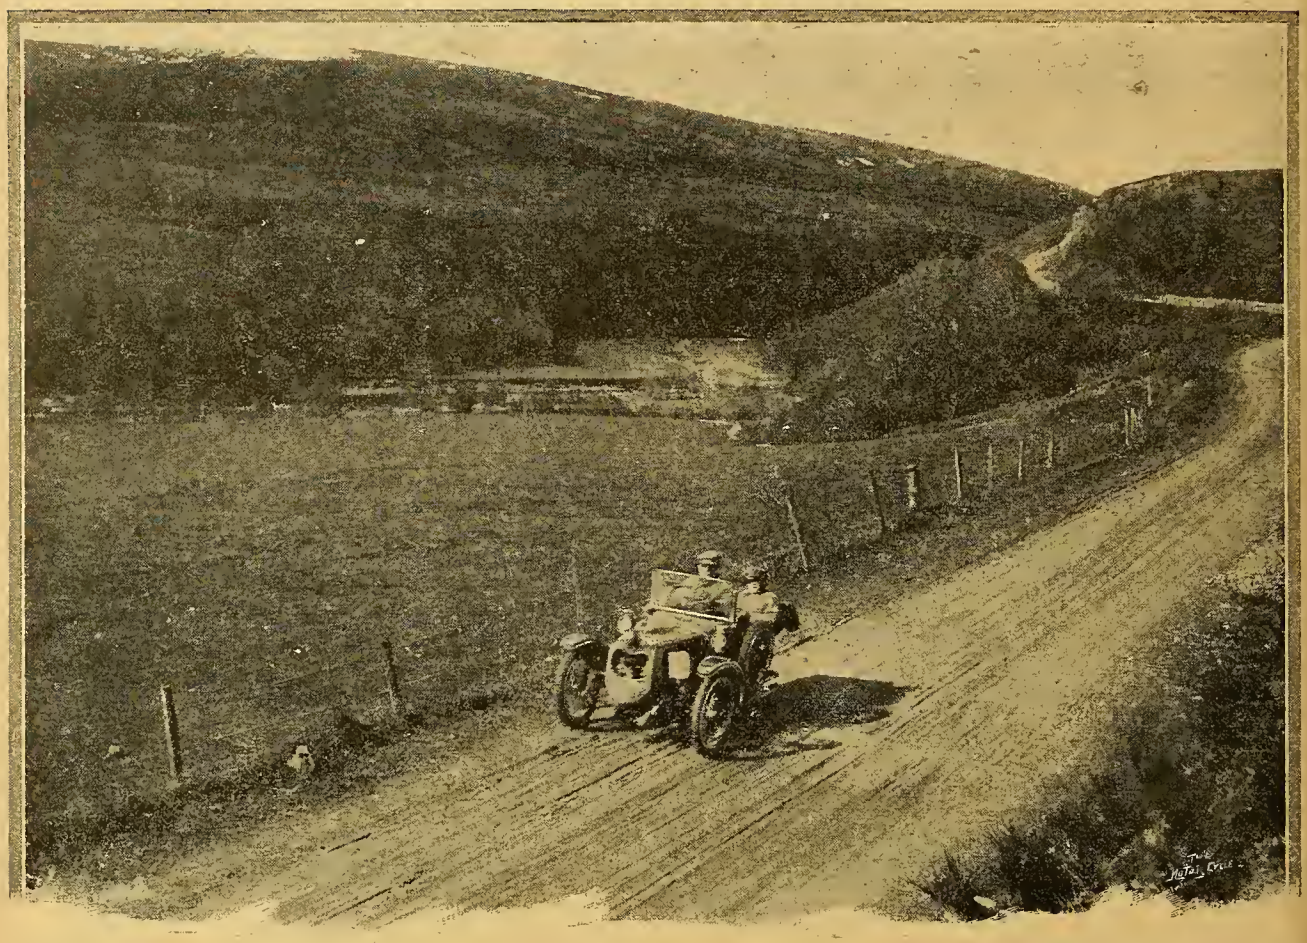
Very few houseowners who add a car garage escape a reassessment, and consequently the paying of extra rates for the privilege. In some cases the extra rates have been almost as much as the cost of renting a garage. In addition, an extra water rate is charged for the advantage of being able to wash one's own car. On the other hand, a sidecar may be accommodated in a portable shed. The difference on the interest of capital outlay is also a matter to be considered.

Of course there will be many new light cars on the road next year, but that section of the motoring public using big sidecar outfits will not be diminished in any way; in fact, it will increase just as the number of users of large cars will increase, because there is always a large number of owners "moving up." Whatever any one section will lose at one end, it will more than gain at the other, for the motoring movement, whether it be connected with the smallest lightweight or the most powerful car, is always expanding as more and more people learn the joys of the open road and the real utility of the motor vehicle.

Speed is another point where the big sidecar scores over the small car, which very often is fitted with an engine of the same size to propel double the weight.

MODERN THREE-WHEELERS.

Sidecar Alternatives for the 1923 Market



Champion of the three-wheeler movement. H. F. S Morgan in the machine which has made his name famous.

THOSE sidecarists amongst the number which yearly decides, either from the exigencies of business or the urge of the passenger, to seek an enclosed vehicle, will look eagerly to see what 1923 has in store for them.

Strange to say, despite the tremendous interest which is being paid to the development of economical car type machines, few new designs in the three-wheeler class have been announced. Possibly the apparent stagnation in this particular field is due to the fact that it is so easy to over-develop design in the three-wheeled vehicle class. Once the advantages of lightness and simplicity are overlooked, it becomes a moot point whether the four-wheeler is not as easy to evolve and as cheap to build; this solution of the designer's problem, however, is one which throws upon the prospective user all the additional tax and expenses which a full-blown car involves.

However, all the established three-wheeled runabouts are still with us, and certainly they show no sign of losing their popularity; indeed, in one case, thanks to a substantial reduction in price, a record run of success may be expected.

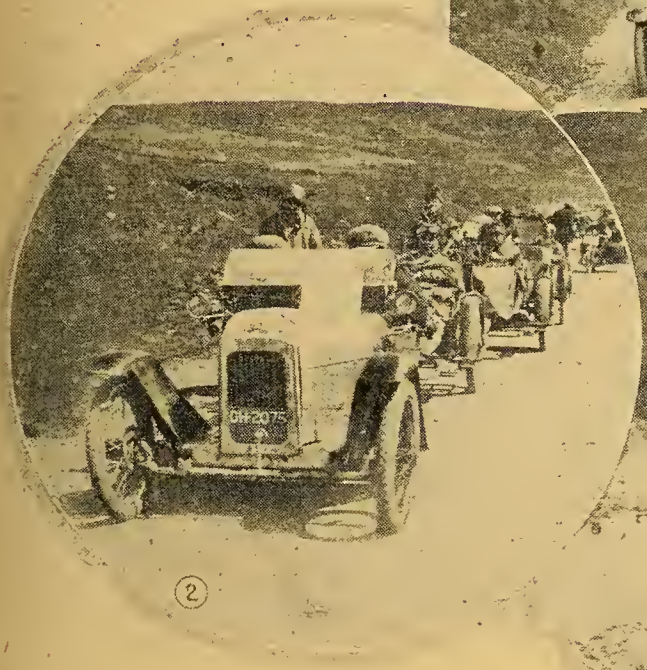
The runabout world resolves itself into two distinct classes: the first devotes its attentions to the simplest types of machine, while the second is mainly concerned with the more elaborate class of vehicle—the complete car on three wheels. Probably of the two the former, chiefly as a result of the energies of one particular maker, has earned the greatest fame.

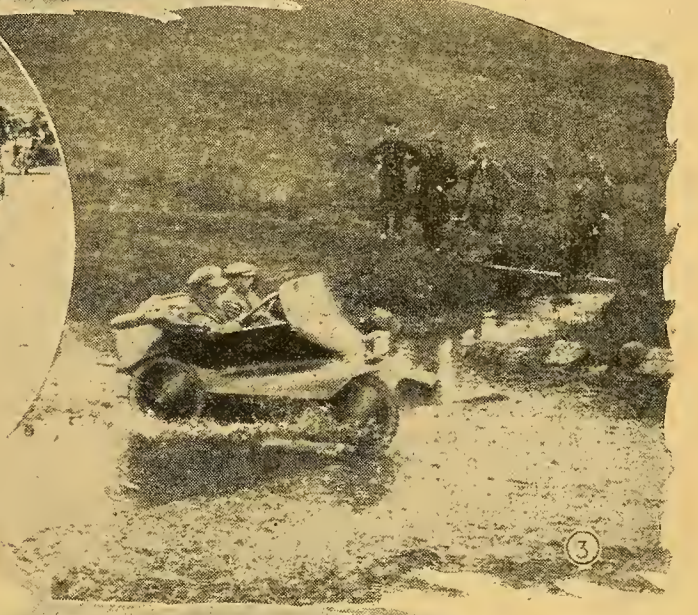
The Simplest Type.

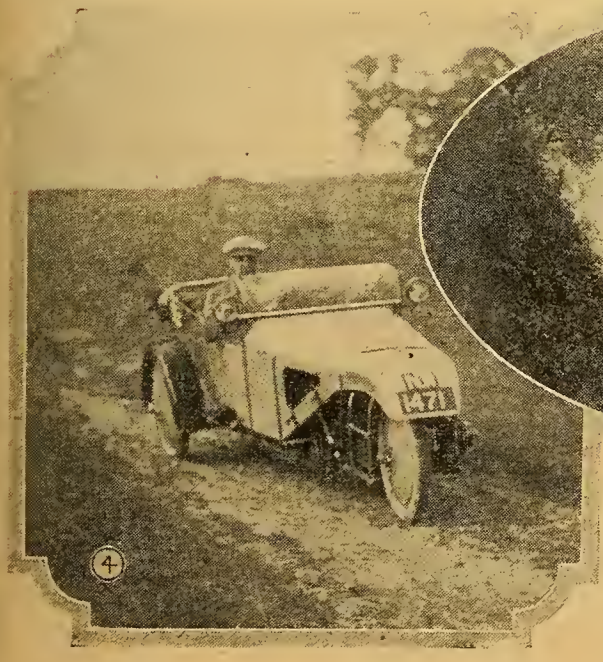
To deal now with particular examples: the Morgan must take pride of place. This well-known machine will remain to all intents and purposes unaltered, but considerable price reductions have already been made which cannot fail to increase the large sales that have been made in the past year. First there is the Popular model, which, although shorn of all unessentials in order to be sold at the very moderate price of £135, is nevertheless equipped with full acetylene lighting apparatus. This model is fitted with the air-cooled J.A.P. engine of 976 c.c. capacity.

Various engine alternatives, both as regards make and air or water cooling, can be had, but these of course involve additional charges.

MODERN THREE-WHEELERS ON TRIAL AND TEST.



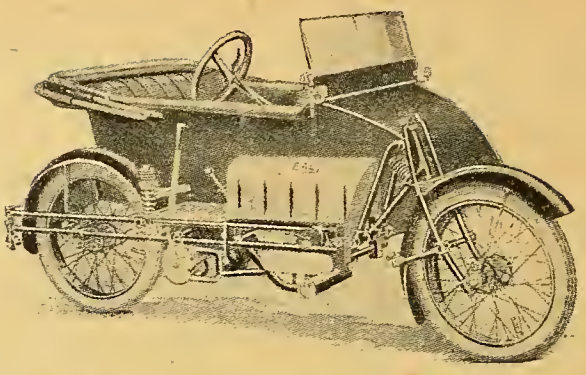




All the runabout machines shown on this page have been subjected to arduous tests, either in official trials or privately, over difficult mountainous country. The following makes are represented: (1) L.S.D. with air-cooled twin engine, shaft and chain drive. (2) New Hudson, water-cooled twin, shaft and chain. (3) Scott Sociable, water-cooled two-stroke twin, shaft drive. (4) Autogear, air-cooled twin, chain and gear drive to front steering wheel, and (5) T.B water cooled twin, shaft drive.

Modern Three-Wheelers.—

To counter the frequent criticisms which are levelled against the small runabout on the score of its limited capacity for accommodating extra passengers, a Family model was introduced more than twelve months ago, and this, of course, is being retained; for use in hilly districts the special four-speed gear box which is made is an extra well worth considering. The Family model provides comfortable seating for two adults and two children.



Based on the sidecar outfit, the Seal Sociable is, in effect, a double-seated sidecar with the driving arrangements brought into the body.

So far the utility patterns alone have been referred to, but naturally those who desire to possess a really lively machine with a high ratio of power to weight will find all their requirements met in the various models of the Grand Prix Morgan—a true high-performance machine of proven ability.

The price of the Family model is £160 in the air-cooled form, while in the water-cooled pattern it is £170. The Grand Prix type costs £160 with the J.A.P. engine (water-cooled), while the M.A.G. engine entails an extra outlay of £7.

Undoubtedly the Morgan, by virtue of its simplicity, stands in a class by itself, and in this respect it is only approached by the Yorkshire-made L.S.D., which follows a somewhat similar layout.

A J.A.P. air-cooled engine supplies the power in the L.S.D. machine, and the drive is by shaft to a two-speed gear box, in which a reverse is also incorporated; a kick-starter is also a feature of this design. Steel wheels of the artillery pattern are used on the L.S.D., and of course they are interchangable. The final drive is by chain, and there are two contracting brakes on the back wheel hub. Three models are available, these being a popular type at £145 19s., a family model at £161 14s., and a more refined example of the two-seater variety at £155 9s. The family model accommodates two adults and two children; the hood when erected covers all the passengers.

Highly Developed Machines.

Still keeping to machines which follow the lay-out that by virtue of long usage may be described as the conventional, the T.B. and the New Hudson must be next described.

The T.B. is available in both air- and water-cooled models, the prices being £155 and £165 10s. respectively. The engine is mounted transversely at the front of the chassis, and bolted directly to the crank case is the three-speed and reverse gear box, the pit of the fabric plate clutch intervening. From a fabric universal joint behind the gear box transmission to the bevel-driven rear wheel is by a shaft. All wheels are interchangable, and the springing is by quarter-elliptics at the front and cantilevers at the rear. Steel tubing, welded at all joints, is used throughout the T.B. chassis. Although apparently somewhat heavy, the performance of the machine is extremely high, as results obtained in all the important reliability trials go to show.

Next comes the New Hudson—an example of the fully developed runabout, or car on three wheels. This machine is of more recent growth than the others which have been mentioned, but it has nevertheless been before the public long enough to amply prove its worth. In the New Hudson the power unit is a water-cooled 1,098 c.c. M.A.G. V-twin mounted at the front of the channel steel chassis and driving through a car type clutch by shaft to a three-speed gear box secured to the rear cross-members of the frame; from a sprocket on the box the drive to the rear wheel is by chain. All wheels are interchangable, and springing throughout is of the quarter-elliptical variety. In external appearance and finish the New Hudson is comparable with the best in the small car world. Complete with electric lighting outfit (by dynamo) and spare wheel, the price of the New Hudson at the present time is £230.

On Sidecar Lines.

Quite separate from the above-described machines are a number designed more closely to follow the lines of the sidecar outfit; most highly developed in this class is, of course, the unconventional Scott Sociable.

This now well-known machine was designed entirely with the performance of the sidecar in view, to which, of course, should be coupled the comfort and protection of the most luxurious car. In these aims the designer has well realised his intentions, for the 578 c.c. two-stroke engine is silent and vibrationless in action, lubrication is automatic, and the compound lever and coil springing gives the essence of comfortable travelling. Gear changing is interlocked with the clutch control, and as the gears themselves are of the constant mesh type the operation is as easy as it is on the best of motor cycles and quite unlike the sleight of hand process so frequently involved on cars. No reverse is fitted, as owing to the steering lock and general mobility equalling that of a sidecar it has not been found desirable.

From the gear box, which is integral with the engine crank case, the drive to the off side rear wheel is by shaft and spiral bevel; independently controlled internal expanding brakes are fitted to both rear wheels.

The Scott Sociable chassis is constructed with a number of standardised tube units bolted together so that an incidental advantage is obtained in the event of frame repairs becoming necessary at any time as the result of an accident. If there are any objections to the plan of the Scott Sociable they are those which apply to the sidecar also, viz. :—that the single wheel on the near side gives a decidedly unsymmetrical appearance and that the off-centre one-wheel drive puts the machine at some disadvantage on abnor-

Modern Three-Wheelers.—

mally steep and rough hills such as those which are included in the more "freakish" reliability trials. Actually both these objections may be dismissed, as they are dismissed by the great majority of sidecar buyers; the question of appearance is a matter of use and custom, and that of loss of tractive effort on abnormal grades is one which only affects those who compete regularly in the more outlandish trials.

Equipped with all accessories, hood, screen, spare disc wheel, and dynamo lighting, the Scott Sociable sells at £176 8s.

Long before the machine above described was on the road a runabout produced in Lancashire and known as the Seal Sociable was marketed. This machine followed even more closely the lines of the ordinary sidecar outfit, inasmuch that it was (and still is) to all intents and purposes a motor bicycle and sidecar with a single frame common to both and an enlarged sidecar body in which the driver and passenger are accommodated. The framework encircles the rear wheel, and the whole is sprung on large coil springs. Steering is effected by a wheel which controls a modified form of motor cycle front fork, while the transmission from the air-cooled big twin engine is by chains through a motor cycle type of gear box. The price is £165; spare wheel extra.

Possibilities in the Unconventional.

Another type of three-wheeler, and one which has great possibilities if only it was more vigorously developed, is that represented by the Autogear, another northern production.

In the Autogear the complete power unit and transmission is located at the front of the chassis, the front wheel acting as both driver and steerer, while the two rear wheels are only called upon to carry the passenger weight and to deal with the braking forces. This layout has obvious advantages; the front wheel driving and steering allows the complete mechanism of the vehicle to be accessibly mounted in the front of the frame, and the front wheel can be sprung to carry a known and practically constant load. As the rear wheels have no other load than the body and passengers, they can be lightly and flexibly sprung and placed as far back from the front as may be desirable; thus a four-seater body without overhang is by no means out of the question.

Steering Advantage of Front Drive.

Less obvious benefits gained with this type of chassis are stability and ease of handling owing to the fact that before the weight of the machine is deflected from its path the actual direction of the power is altered by the movement of the steering wheel; in all other cars and runabouts the mass of the vehicle has to be deflected against the forwardly moving resistance of the rear driving wheel or wheels.

The Autogear has a 1,098 c.c. Blackburne air-cooled engine, a single plate fabric clutch, and a three-speed and reverse gear box in line with the engine shaft; from the box the drive is by a chain to the trunnion bracket which supports the swivelling front wheel, and a short universally jointed shaft completes the drive through an internally toothed reduction gear. All the wheels are carried on stub axles and are of the Lynton disc type. An extra wheel and dynamo lighting, together with a one-man hood which encloses the entire "occasional four-seater" body is included at an approximate price of £200.

B.M.C.R.C. MATTERS.

Aggregate Prize Won by Le Vack. More Records Recommended.

AT the last committee meeting of the British Motor Cycle Racing Club last Monday week, several announcements were made of interest to the motor cyclists who attend Brooklands meetings.

In the first place, the marking for the season's aggregate prizes has resulted in the following placings:

1.—H. le Vack, 158 marks.
2.—C. E. Temple, 107 marks.
3.—E. Remington, 102 marks.

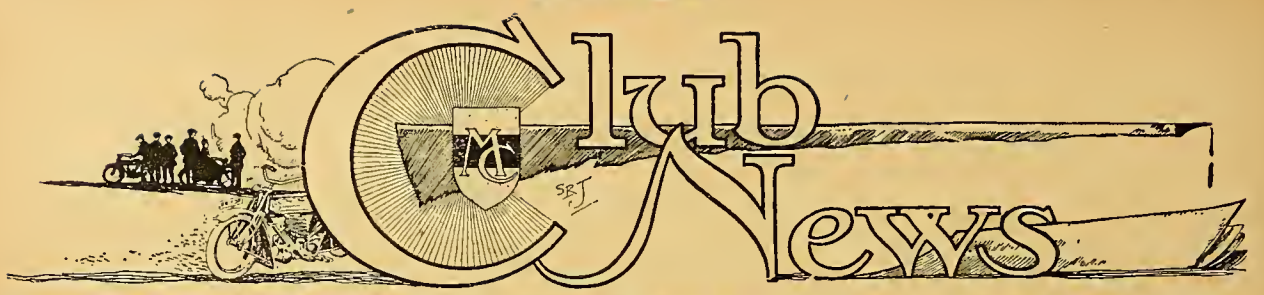
Le Vack and Temple, therefore, qualify for the 50-guinea Aggregate Cups presented by Mr. A. V. Mellano and the B.A.R.C. respectively. Incidentally, V. Horsman, who did so well at the Championship meeting, added no fewer than 90 marks to his previous aggregate, and, pulling up 18 places, finished fourth on the list.

The matter of the disqualification of a competitor at the Championship meeting, on account of his sidecar passenger not wearing a crash helmet, was raised. The facts are that the committee decided several months ago that a crash helmet should be worn by both driver and passenger, but, as this rule has been omitted from the entry forms, the committee agreed that it would be harsh to enforce it on the occasion in question, although it was agreed that the stewards of the meeting had acted in good faith on the facts as presented to them at the time. The competitor concerned, A. Gayder Smith (490 Norton sc.), is, therefore, reinstated in second place in the All-comers' Passenger Handicap, Horsman thus becoming third.

A record number of spectators attended the Championship meeting, but the committee's pleasure at this announcement was somewhat damped by the Secretary's production of a claim from the Inland Revenue authorities totalling about £80, on account of entertainment tax due on *members' subscriptions* for the years 1920-21-22. Membership of the B.M.C.R.C., of course, carries with it the right of free admission to the track, and it is on this account that there appears to be a liability for entertainment tax on such proportion of the subscription as may be estimated to be in lieu of admission fee.

Secretaries of motor cycle clubs which intend promoting one Brooklands meeting per season should be careful, therefore, not to announce free admission to the track on this occasion as being one of the benefits of membership of the club.

After some discussion, it was decided to recommend to the A.C.U. that the 7 hours, 8 hours, 9 hours, 10 hours, and 11 hours records should be recognised.



Coventry and Warwickshire M.C.

It has been decided to re-run the Manville Cup Trial, owing to so many competitors having lost their way through insufficient route marking. The new date is Saturday, the 18th inst.

Yorkshire Centre A.C.U.

The second annual dinner will be held on Saturday at 7 p.m., at the Queen's (Midland) Hotel, Leeds; ladies are invited. During the same afternoon the annual general meeting will be held at the Guildford Hotel, Leeds.

Cambridge University M.C.C.

Results of the recent sporting trial are as follows:—

FULL MARKS IN SOLO CLASS.—L. A. Humphreys (557 B.S.A.), R. Chalmers (498 Zenith-Bradshaw), E. W. T. Howard (492 Sunbeam), J. A. Orr (499 Sunbeam). Results of the timed hill climb give the premier award to E. W. T. Howard and the second award to J. A. Orr.

SIDECARS.—O. G. Smart (490 Norton sc.), premier award. A. B. Calkin (770 B.S.A. sc.) and F. Robinson (1,087 G.N.) tied for second place, which on the result of the timed climb is taken by A. B. Calkin.

Bradford M.C. and L.C.C.

Heavy rain having curtailed the Club's handicap speed trials on the 21st ult., the event had to be completed on the following Saturday. Results:—

SILVER CUP (won outright).—G. W. Cooke (486 Scott Squirrel), handicap as 65 m.p.h., actual 70.02 m.p.h.

SILVER MEDAL.—R. Turner (494 Douglas), handicap as 70 m.p.h., actual 74 m.p.h.

BRONZE MEDAL.—F. Catterick (494 Douglas), handicap as 70 m.p.h., actual 72.28 m.p.h.

SILVER CUP FOR FASTEST SOLO TIME.—R. T. Cawthorne (490 Norton), 85.7 m.p.h.

Liverpool M.C.

Results of the Reliance Cup trial are as follows:—

RELIANCE 50 GUINEA CHALLENGE CUP.—G. F. Burns (492 Sunbeam).

BURNS AMATEUR CHALLENGE CUP.—G. S. Boston (532 Scott).

BUTTERWORTH CHALLENGE TROPHY.—S. Doward (247 Sun Vitesse).

MOGRIDGE MEMORIAL CHALLENGE CUP.—L. Randles (492 Sunbeam).

GOLD MEDALS.—G. F. Burns (492 Sunbeam), 100 marks; G. S. Boston (532 Scott), 100; R. Brown (492 Sunbeam sc.), 100; W. J. Kellett (492 Sunbeam), 100; S. Doward (247 Sun Vitesse), 97; L. Randles (492 Sunbeam), 97; F. H. Hawkins (348 Raleigh), 97; H. Gibson (348 Raleigh), 97; C. H. Fox (557 B.S.A.), 97; J. H. Fox (633 Norton), 95; E. L. Boston (486 Scott), 95; J. Westwood-Wills (547 Powell), 95; A. Bennett (492 Sunbeam), 95; G. Warbink (492 Sunbeam), 95; E. Eggers (349 A.J.S.), 95; W. H. Hadfield (348 Raleigh), 95; J. H. Green (348 Excelsior), 95; J. H. Simpson (349 A.J.S.), 95; N. H. Brown (349 A.J.S.), 95.

SILVER MEDALS.—W. Clough (532 Scott), 94 marks; A. R. Evans (492 Sunbeam), 94; G. L. Falck (498 Rover), 94; H. Marston (349 A.J.S.), 93; Miss M. Cottle (547 Powell), 92; P. G. Thomason (398 A.B.C.), 92; E. H. Welch (490 Norton), 92; Graham Oates (249 Grindley), 91; S. Crabtree (499 Sunbeam), 90; S. Ollerhead (494 Douglas), 90; V. Horsman (633 Norton sc.), 89; O. Wade (799 A.J.S. sc.), 88.

Awards for best performance in each class:—

Solo up to 275 c.c.—S. Doward (247 Sun Vitesse).

Solo up to 350 c.c.—H. Gibson (348 Raleigh).

Solo up to 500 c.c.—G. F. Burns (492 Sunbeam).

Solo over 500 c.c.—G. S. Boston (532 Scott).

Sidecars up to 600 c.c.—R. Brown (499 Sunbeam sc.).

Sidecars up to 750 c.c.—V. Horsman (633 Norton sc.).

Sidecars over 750 c.c.—O. Wade (799 A.J.S. sc.).

WINNING TEAMS.

Machine Team.—Sunbeam team: R. Brown, A. Bennett, G. F. Burns.

Club Team.—Liverpool Club lightweight team: J. H. Green, H. Gibson, N. H. Brown.

Nominated Team.—E. L. Boston, G. S. Boston, G. F. Burns.

Richmond and District M.C.C.

A novel "Follow-the-confetti" trial will take place on the 19th inst., starting from the Angel Hotel, Thames Ditton, at 11 a.m. Should weather conditions make the event impracticable a postponement until the following Sunday will be made.

Cardiff M.C.C.

A dance will be held at the Pavilion Café on the 22nd inst., commencing at 7.30 p.m. Applications for tickets should be made to Mr. F. E. Jenkinson, 6, Romilly Crescent, Cardiff, or Mr. R. Bevan, Onstle Street, Cardiff.

Rotherham and District M.C.

Results of a reliability trial held over a course of 80 miles in the Derbyshire district are as follows:—(1) C. Beaumont (550 Triumph), 2 marks lost; (2) G. Bennington (500 N.U.T.), 3 marks lost; (3) D. Lister (348 Excelsior-Blackburne), 4 marks lost.

Bridgend and District M.C.C.

The above club's first reliability trial was run off successfully over a fifty-two miles course on the 25th ult. Nineteen competitors started, including one lady rider. Results:—

GOLD MEDAL.—H. R. Thomas (349 A.J.S.).

SILVER MEDAL.—C. Powell (499 Sunbeam).

BRONZE MEDAL.—F. Hawkins (499 Sunbeam).

Reigate, Redhill and District M.C.C.

"Old crocks" and single-gear machines participated in a trial held on the 1st inst., but the event was spoiled by heavy rain. The following results were recorded:—

SINGLE-GEAR MACHINES.

GOLD MEDAL.—E. F. Bewers (499 Triumph).

SILVER MEDAL.—E. C. Gordon (499 Triumph).

"OLD CROCKS" (1913 OR EARLIER MODELS).

GOLD MEDAL.—A. G. Harris (348 Douglas).

Lichfield and District M.C.C.

Results of the second round for the Hoskinson Cup, run off on the 15th ult., together with results of the first round, are as follows:—

HOSKINSON CUP.—F. H. Twyman (499 Sunbeam), 380 marks.

GOLD MEDAL.—J. J. Smith (490 Norton), 378 marks.

SILVER MEDAL.—G. Finch (584 Harley-Davidson), 371 marks.

BRONZE MEDAL.—A. J. Button (550 Triumph), 370 marks.

Surrey M.C. and L.C.C.

Hard going in narrow, winding lanes, a flexibility hill-climb, and 45 miles in darkness were some of the ingredients of a half-day trial for the Bateman Challenge Cup which took place on the 28th ult. Incidentally, the reliability of modern lighting systems was most marked. Results:

BATEMAN CUP AND GOLD MEDAL.—A. C. Brookes (499 Blackburne sc.), 100 marks.

SILVER MEDALS.—T. G. Meeten (249 Triple H.), 97½ marks; P. W. S. Bulman (976 Zenith sc.), 96¼ marks.

BRONZE MEDALS.—C. B. I'Anson (499 Zenith-B.), 78½ marks; Rev. Carver (998 Rudge sc.), 73 marks.

Southport M.C.

The fifth and last trial of the season for the "Blake" and "Taylor" Cups was run off on the 29th ult. Competitors covered a very sporting course of sixty-six miles, which included two water-splashes and three observed hills. Awards were made as follows:—

TAYLOR CUP, 1ST CLASS CLUB AWARD AND SPECIAL PRIZE IN SIDECAR CLASS.—E. H. Clifton (976 Enfield sc.).

BLAKE CUP, 1ST CLASS CLUB AWARD AND SPECIAL PRIZE IN OVER 350 c.c. CLASS.—E. H. Hope (976 Brough Superior).

FIRST CLASS CLUB AWARD AND SPECIAL PRIZE IN 350 c.c. CLASS.—G. W. Williamson (349 A.J.S.).

SECOND CLASS CLUB AWARDS.—V. F. Crosthwaite and W. H. Allison.

South-East Essex M.C.C.

A club is being formed in South-East Essex. It is proposed that events covering all branches of the sport and catering for all types of machines be organised. Those interested are invited to attend a meeting at "Cotgroves," 16, High St., Southend-on-Sea, to be held on the 16th inst., at 7.30 p.m., or to communicate with Mr H. T. Baldwin, The Bungalow, South Woodham Ferrers, Essex.

Dublin and District M.C.C.

A trial for a trophy presented by the Manufacturers' Union was run off on the 28th ult. Snow and hailstorms troubled competitors on the higher points of the course, but on the whole the weather was good. Among the observed hills Goat Pass accounted for the greatest number of failures, quite one-third of those who attempted it coming to grief. Thirteen of the finishers secured full marks at the open controls. Of these J. A. Carvill (557 B.S.A.) had the least variation at the open checks, thus winning the Manufacturers' Cup. T. E. Greene (494 Douglas) and G. Briggs (550 Triumph) were second and third respectively. Gold medals were also won by: R. Murphy (499 Triumph), P. H. Hurse (490 Norton), S. Woods (348 Cotton), W. T. Malcomson (1,087 G.N.), J. Healy (749 James sc.), C. D Maguire (993 Matchless sc.), C. C. Callaghan (500 N.U.T.), J. G. Burney (225 Enfield), H. G Ellerker (349 A.J.S.), A. A. Wayte (492 Sunbeam). Silver medals: D. Allen (633 Norton sc.), G. Tracey (976 Sparkbrook), R. G. Gibson 348 Raleigh), E. A. Tracey (596 Indian), J. C. Cathcart (600 Humber), R. Walshe (500 James), T. F. Slevin (292 Velocette), H. B. Evans (348 Douglas).

Birmingham M.C.C.

Results of the sporting half-day trial held on the 21st ult. are as follows:—

SILVER CUP for best performance, solo class.—R. W. Duke (550 Triumph).

SILVER CUP for best performance, sidecar class.—F. H. Brown (998 Rex-Acme sc.).

SILVER MEDALS.—V. H. Smith (490 Norton), T. Lane (490 Norton), H. G. Uzzell (348 New Imperial), B. Bourke (498 New Hudson), T. Laurence Cox (292 Allon), B. L. Bird (557 B.S.A.), J. Lidstone (350 James), J. Cotton (749 James sc.), G. Kimberley (350 James), P. Cope (490 Norton), R. Edwards (247 Levis), R. W. Duke (550 Triumph), S. J. Neal (518 Neal-Dalm), R. C. Cooper (292 Allon), L. E. Clulee (292 Allon), E. F. Hollyoak (249 Federation), J. Stretton-Ward (499 Triumph), F. H. Brown (998 Rex-Acme sc.), E. R. Jacobs (350 Beardmore-Precision), C. S. Burney (598 Beardmore-Precision), H. Greaves (598 Beardmore-Precision), H. S. Perrey (557 B.S.A.), J. G. Orford (348 Henley-Blackburne). Mrs Thrush (498 Sunbeam), L. Bacon (490 Norton).

Surbiton M.C.

Practically the whole course of the Ballard's Cup Trial, on the 28th ult., was of a colonial nature. Starting at the Angel Hotel, Thames Ditton, the course followed a tortuous route of forty-three miles to Ripley. No competitor actually made a non-stop run, but a number of stoppages were caused by baulks. The trial was not devoid of incident; Charlesworth (976 Zenith sc.) turned over on Leith Hill, fortunately without injury to himself or his passenger, while Miss Mackintosh (584 Harley-Davidson sc.) broke her frame in the Oxshott Common section and retired. O. E. Taylor (Vasco) caused much excitement by taking the Shere water-splash at speed, causing the spectators to beat a hasty retreat. Among the solo men an excellent performance was made by B. F. G. Fowke (350 Beardmore B. and S.), also by F. E. Salter (350 Zenith) and R. C. Stannton (550 Triumph). Results:—

BALLARD'S CUP AND GOLD MEDAL.—B. Alan Hill (9.5 Rhode).

GOLD MEDAL for best sidecar performance.—E. O. Spence (998 Harley-Davidson sc.).

BRONZE MEDALS.—W. R. Preston (492 Sunbeam), R. C. Stannton (550 Triumph), O. T. Ashby (349 Wooller), E. A. Bridgman (998 Indian sc.), Geo. Baxter (998 Harley-Davidson sc.), L. G. Seth Smith (10 A.B.C. car).

One number plate must be illuminated as above *vide* Road Vehicles Registration and Licensing Order (1921). According to the Lights on Vehicles Regulations (1903) the lamps ordinarily required by law may be lit half an hour later.

Next Week's Issue.

Next Thursday's issue of *The Motor Cycle* will be a forecast and guide to the Olympia Motor Cycle Show.

Nomenclature.

One manufacturer is introducing a model named the All-Black Baby—presumably an offspring of the Coal Black Mammy?

Reversing Things.

On another page a new brake is described which reverses accepted practice by making the shoe of metal and the drum of fibre. If this reversing process goes too far, some Heath Robinson inventor will make an engine with a cylinder moving up and down outside the piston.

A Swedish Show for Motor Cycles.

Under the patronage of the King of Sweden, an International Exhibition for cars and motor cycles will be held at Gothenburg, May to July, 1923. The exhibition is being organised by the Royal Swedish Auto Club in connection with the Jubilee Exhibition in Gothenburg.

Reunion Dinner.

Members of the R.N.A.S. who served in German East Africa, 1916-1918, are invited to the Third Annual Dinner, to be held at Gatti's, Strand, on December 1st. Those wishing to be present should write immediately to Mr. C. R. Lucato, 17, Garden Avenue, Mitcham, Surrey, or Mr. C. S. Thompson, 25, Wharncliffe Gardens, N.W.8.

The Price Margin.

Every year sees a number of sidecar owners joining the car brigade for the reason that it is a natural sequence of events. As one gets older it is to be expected that the bank balance shows an improvement. Apart from these, however, we do not expect any of the motor-cycling fraternity to join the ranks of car owners merely because light cars are cheaper. The prices of sidecars, too, will be down next year, and the margin between the *best* sidecar and the cheapest car will be as proportionate as it has ever been.

Ban on Schoolboy Motor Cyclists.

Boys at Marlborough College have been forbidden to ride motor cycles during term time. According to the master of the college the reasons for the ban are "obvious." Perhaps we are very dense.

Express Train Speeds.

More than 100 m.p.h. was attained by a G.W.R. train as long ago as 1904, says a London evening paper. Apparently the public fears speeds above 60 m.p.h. and is therefore kept in ignorance.

Straight-through Pipes Legal.

The Chief Constable of Wolverhampton has given a certificate to the manufacturers of the Sunbeam motor cycle that the straight-through pipe and fish-tail arrangement on their long-stroke model complies with the law as regards silence.

Practical Sympathy.

When a Southport member of a local motor club was fined £10 for dangerous driving—actually, acceleration to avoid a steam wagon "cutting" a corner—contributions towards the fine were sent by local motor cyclists.

A New Feature for Gymkhanas!

The cover of a certain new boys' paper contains an illustration of a daring solo motor cyclist who, at express speed, bends down and picks up the unconscious heroine from the roadway. Curious as to how he did this, we read that he merely "gritted his teeth."

A Sad Loss.

It is with deep regret that we have to announce the death at Leeds on the 29th ult. of Mr. George R. Grundy. Mr. Grundy was for two years a vice-president of the Yorkshire Centre A.C.U., and for many years an enthusiastic member and committee man of the Bradford M.C. and L.C.C. and the Wakefield and District Club.

A.C.U. Centre Dinner.

A large number of awards will be distributed at the Yorkshire Centre A.C.U. Dinner, to take place at the Queen's Hotel (Midland Station Hotel), Leeds, at 7 p.m. on Saturday. Tickets may be obtained through the hon. secretaries of clubs, or from the centre hon. secretary at 26, Beamsley Road, Frizinghall, Bradford. At 4 p.m. on the same date a Centre Board meeting will be held.

Silencing.

Even amongst sports models few machines will be sold next year without reasonably efficient silencing apparatus.

Proprietary Units.

Many firms hitherto producing their own gear boxes are adopting proprietary components for their machines.

An Early Three-wheeler.

On Page 720 will be found an illustration of Pennington's famous tricar of 1896.

Tank Design.

Tank design is developing. A few years ago the majority of tanks had sharp edges which quickly lost their enamel. Present-day fashion is to have decidedly rounded corners.

Cheapest Motoring for Two.

We wonder whether any of the new ultra-lightweights will be found at Olympia fitted with sidecars such as were shown at the recent Paris salon.

Guaranteed Against Punctures.

It is a good scheme on the part of one maker to fit anti-puncture compound filled inner tubes to his models and give a guarantee against punctures.

More Solo Models.

Makers of big sidecars are deciding to tap the solo market. Martinsyde and Matchless are the latest converts to the popular "350"—and others are expected at the Show.

Police Sidecar T.T.

In hot pursuit of a speed fiend, a Liverpool motor cycle policeman on a 499 c.c Rudge-Multi *and sidecar* attained 59 m.p.h. A reader suggests that we should approach this gentleman for another article on the secrets of tune.

Forbidden Smoke.

Motor cyclists passing through the West End of London should reduce their oil supply to a minimum. Several readers have been warned for creating a slight blue haze when their engines were running in neutral. An old bye law prohibits exhaust smoke, but not, apparently, real smoke from, say, a steam wagon.

A proper mix-up.

"American X, new *5 6 h.p Jap* twin, *O.H.V.*, 3-speed kick start, countershaft, elec. light and horn, also *Klaxon Atmes* carb., *Streemaline* sporting sidecar, well covered in, all in nearly new con., smartest turn-out on the road." A recent advertisement, but, strange to say, *not* under the "Miscellaneous" heading.

ADVANCE DETAILS OF 1923 MODELS.

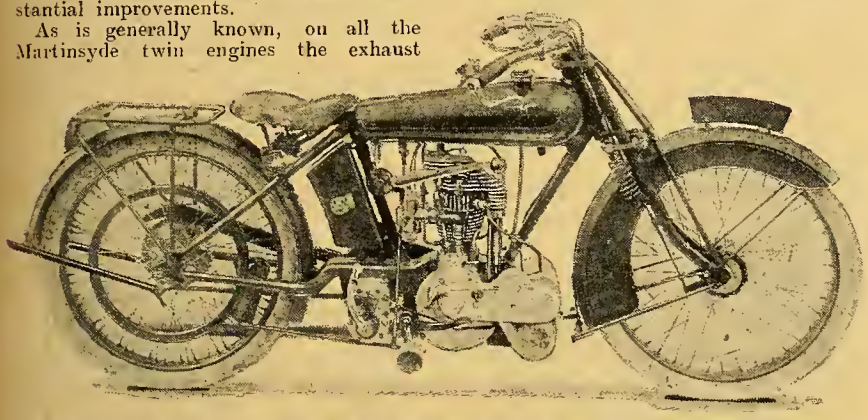
SOLO SINGLE MARTINSYDE.

New 347 c.c. Touring Model with Overhead Exhaust Valve.

NO one can accuse the firm of Martinsyde, Ltd., of letting the grass grow beneath its feet, for its record has been one of steady progress and well-deserved success.

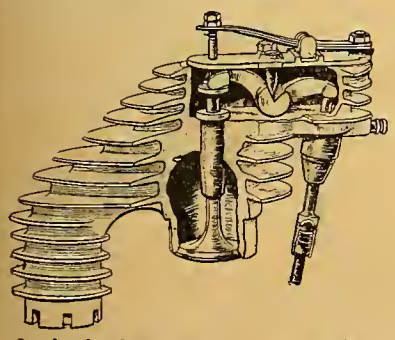
The latest example of enterprise is to be seen in the new 347 c.c. single cylinder touring machine, in which the special features of Martinsyde engine design have been embodied, together with several substantial improvements.

As is generally known, on all the Martinsyde twin engines the exhaust valves are above the cylinders, where they can get the maximum amount of cooling, while the inlet valves are carried in the position usually occupied by the exhaust in an engine of more conventional design.



Silent valve mechanism, and mechanical lubrication are features of the 347 c.c. Martinsyde.

In the 1923 model, however, the exhaust valve mechanism has been greatly improved and reduced to the lowest number of working parts; it consists merely of a rocker bearing on a knife edge attached to a plate held to the detachable head by two bolts. Another bolt secures the cantilever laminated valve spring, which is carried outside and so subject to the maximum amount of cooling. The rocker is always kept up against the knife edge by the light spring which serves to keep the push rod up to its work. It will thus be seen that only four nuts need be undone to allow the valve actuating mechanism to be removed, while it is a simple matter to detach the head.



Overhead exhaust valve and pocket of the 347 c.c. model. The knife-edge rocker and leaf spring are unconventional features.

Mechanical Lubrication.

Lubrication is by means of a Showell mechanical pump with a sight feed, through which it delivers oil into the back of the lower portion of the cylinder wall. From the crank case breather a pipe is led through the front chain cover so that the chain is always adequately lubricated by oil spray. The drive for the pump is both simple and ingenious, consisting of an idler sprocket driven off the top run of the magneto chain, the sprocket spindle being carried on two ball-bearings.

In the touring model a cast-iron piston is employed with two rings, of which the bottom one is used as a scraper, but for the sports model a Ricardo aluminium piston is used.

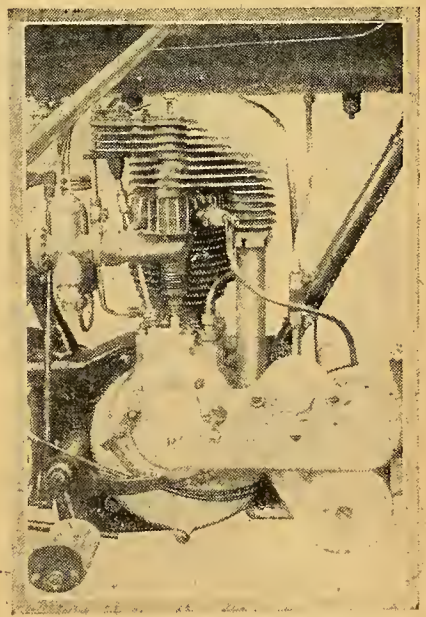
Fixed by means of copper rings, the gudgeon pin is of ample size, while the flywheels are of high tensile cast-iron, machined all over.

The rear brake is operated by the rider's right foot, and has a simple push-on action, while the front brake is a Webb internal expanding. A front wheel stand is fitted.

Considerable ingenuity has been displayed in the fixing of the petrol tank, which is held by means of a cleverly designed clamp, practically invisible and involving absolute security in its attachment. The saddle is only 28½ in. from the ground. In the case of the standard model, rubber covered footboards will be fitted, but in the sports model footrests will take their place.

Fitted with a Sturmey gear box having ratios of 5.2, 8, and 15¼ to 1, with a gear lever fitted to a lug on the saddle tube, adequate chain guards and excellent mudguarding, the machine should prove to be a thoroughly useful touring mount. Naturally the sports model will include such essential fittings as a close-ration gear box, T.T. handle-bars, and a special racing model Amac carburetter.

Prices of Martinsyde machines for the coming season are: "Quick-Six," £125; 678 c.c. standard and sports sidecar outfits and tradesman's carrier, £130. That of the 347 c.c. machine has not yet been fixed.



A close-up view of the 347 c.c. Martinsyde showing the new valve gear, exhaust outlet and the situation of the Showell pump.

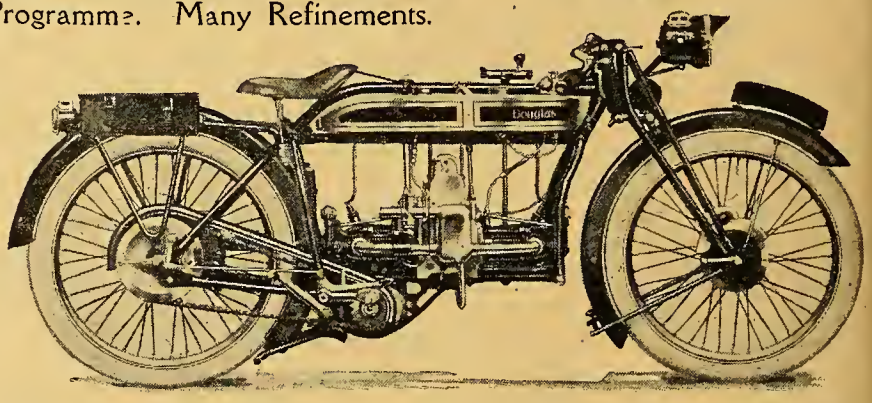
CHAIN DRIVE THROUGHOUT DOUGLAS RANGE.

348 c.c. Model now offered with Alternative Transmissions. Wide Scope of 1923 Programme. Many Refinements.

DOUGLAS is a name that needs little introduction. It is doubly famous as the pioneer of the flat twin and the 350 c.c. lightweight, and in another form, as the only 500 c.c. motor cycle to attain 100 m.p.h.

Changes for 1923 consist chiefly of detail improvements, but three variations of existing models, virtually earning the term new models, deserve attention. These are the chain-driven 348 c.c. lightweight, the chain-driven 595 c.c. machine, and a model of the 733 c.c. machine specially designed for solo use.

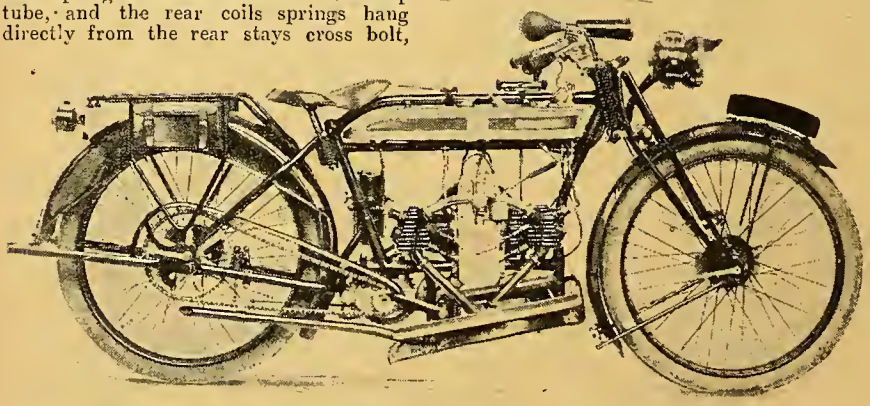
Many of the features on the sports models have been incorporated in the new lightweight, including improved contracting wedge type brakes and knock-out spindles on both wheels, and a transmission shock absorber in the flywheel. Considerably improved mudguards have also been evolved, and the silencer is doubly larger than hitherto.



Now standardised as a sports solo mount, the 733 c.c. o.h.v. Douglas will appeal to the big twin enthusiast despite its moderate engine size.

Engine and Saddle Refinements.

All the engines of the 348 c.c. machines (two-speed belt, three speed belt, and three-speed chain) have received attention, "H" section connecting rods of special material being now fitted. Also a new saddle suspension has been designed; the front is supported by a single leaf spring attached direct to the top tube, and the rear coils springs hang directly from the rear stays cross bolt, thus giving an appreciably lower riding position.



Many of the features on the larger sports models are incorporated on the new chain-driven lightweight.

As a proved example of high efficiency design the o.h.v. 494 c.c. engine has not been greatly altered. Careful thought, however, has been given to the provision of the most suitable steels for valves, rockers, etc. Wick lubricated rockers, double roller big-end bearings, double row ball main shaft bearings, and its other distinctive features are, of course, retained.

The rear axle unit, including the rear wheel shock absorber (there is another on the engine shaft), has been re-designed in a considerably more robust form; and greater leverage and consequently a lighter handle-bar operation is provided for the clutch. The handle-bar fixing has also been "cleaned up," so as to give a lower and more comfortable position for speed work. The new type of saddle suspension is again employed, and the mudguards are exceptionally efficient for a sports model.

In general the above-mentioned changes apply to the 733 c.c. machine in its solo form, and, in part, to the large sidecar outfit. Aluminium footboards or adjustable foot-rests are optional on the solo edition, which, although some way from 1,000 c.c., should prove a very capable upholder of the reviving British big twin class.

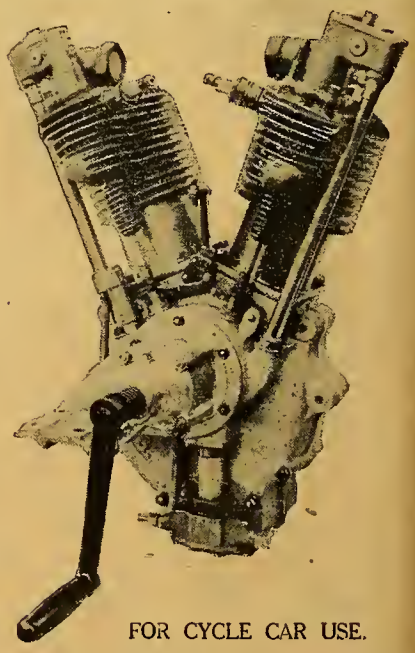
For fast sidecar work the gear box has been strengthened up, particularly the pinions, which are now of the stub tooth type in 5 per cent. nickel steel. Separate legshields replace the 1922 type of single auxiliary guard, and a pillion seat has been incorporated with the lid of the combined rear carrier and tool box. The sidecar body carries a neat luggage grid, and is fitted with the special Douglas sliding dash and a Triplex windscreen, with a curved face if desired. Various slight improvements have combined to make the sidecar chassis more than strong enough for this very fast machine.

Quite a different type of vehicle is the 595 c.c. Douglas, which is available, solo or sidecar, with final chain or belt.

The belt-driven machine remains substantially the same as before, although the cylinder heads, mudguards, and saddle have all been improved. Chain-driven, it follows the lines of the sports models in transmission, wheels and brakes. Touring or flat bars are supplied.

Absolutely complete equipment is supplied with every Douglas model.

A NEW M.A.G. ENGINE.



FOR CYCLE CAR USE.

An improved air-cooled M.A.G. engine with two eccentrically driven oscillating valve oil pumps. Long nuts are fitted to the inlet dome studs.

RUDGE DETAIL CHANGES.

Many Refinements in Construction and Finish. A New Light Sidecar

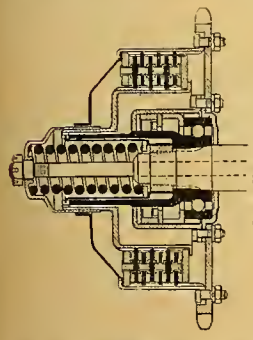
NOT very much change is visible in the latest type Rudge machines since the manufacturers are satisfied with the lay-out and have concentrated on refinements, most of which are not visible to the casual observer.

The two most obvious changes are a modification in the shade of green employed for the tank and the fitting of a roomy tool bag on the top tube. This, of course, is an ideal place to carry tools, since they are subjected to considerably less vibration and jolting than when placed on the carrier.

A full kit of tools placed edgeways on either side of the top tube is carried in the Rudge tool bag, which is very much more generous in proportion than is usually the case. Within the lid, also, are divisions for such tools as are required most frequently.

The tunnel covering the top tube in the bottom of the case is slightly increased in depth so as to house the cable of the speedometer drive. This drive is very neatly carried out, the actual gearing being mounted on the rear frame in such a manner that should the wheel be removed for tyre repairs the driving mechanism is left *in situ*.

Naturally, the Rudge fork, which has always been a most admirable feature,



Section of the new Rudge countershaft clutch. The simplicity of construction and the large single spring are noteworthy features.

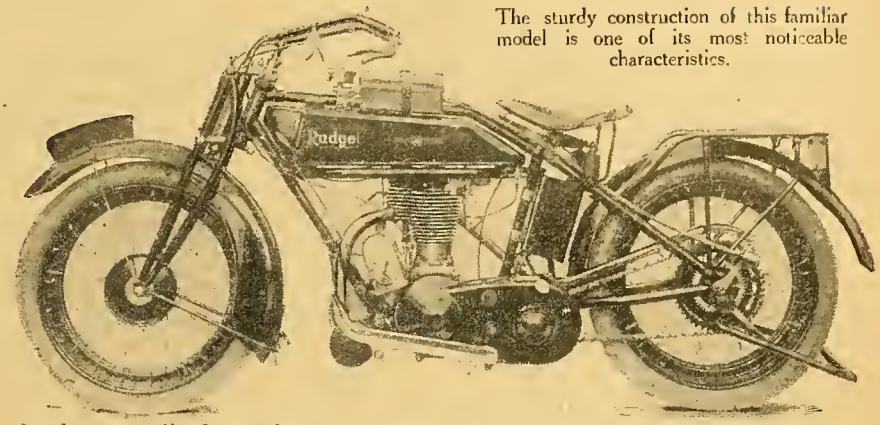
remains unchanged; but the mudguarding has been somewhat improved by the employment of 6 in. domed guards, the front guard being valanced for the rear half of its arc; the rear portion of the back guard forms part of the number plate, and is hinged to the carrier as usual.

Countershaft Clutch Standardised.

In the transmission arrangement of the chain-driven machines an interesting change has been made which was foreshadowed in the Tourist Trophy mounts, for the clutch is no longer mounted on the engine shaft. Instead it is mounted on the gear shaft.

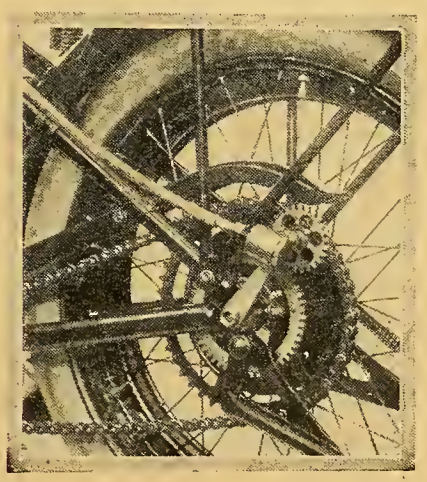
The design of the clutch is very well thought out; the chain ring, with an internally serrated drum, rotates on a ball and roller bearing on a sleeve extension of the gear shaft; and this extension, mounted on serrations, is in turn held in position by a nut.

Within the sleeve member lies the powerful single spring which serves to compress the plates, four of which, fabric-



The sturdy construction of this familiar model is one of its most noticeable characteristics.

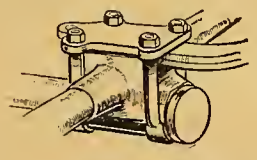
faced, are splined to the outer shell. Running between these are corresponding steel plates mounted on serrations on the inner shell, which in its turn is slidably mounted on the gear shaft extension.



Rear wheel drive has been adopted for the speedometer.

All the above details apply equally to the 499 c.c. and 998 c.c. models, which are similar in their general lines; the latter, however, is fitted with 700×80 mm. cord tyres.

Except for minor alterations, the well-known Rudge Multi is unaltered. It is,



Assembly of the sidecar axle on the frame member.

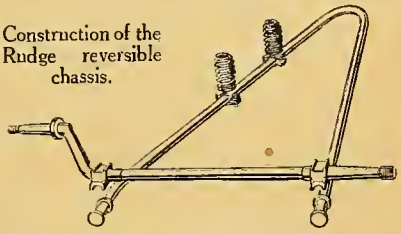
of course, a particularly suitable model for fast solo touring work.

An addition to the range of the sidecar bodies is a very simple and pleasing doorless model finished in green to match the machine. It has graceful lines and a roomy back, while in construction the floor has been made the foundation of the body, and is consequently fully strong enough to take the weight of a passenger even when standing upright without any other support.

Right or Left Hand Sidecar.

The ingenious construction of the chassis is also well worthy of note. In brief, it consists of a tubular hairpin, one side of which lies parallel with the centre line of the machine; this hairpin is made rigid by a very powerfully constructed rear axle consisting of a straight tube with massive forgings at both ends. The axle is clipped to the main chassis

Construction of the Rudge reversible chassis.



at either end, and the U bolts employed for this purpose serve also to hold the spring pads in position. By the simple process of undoing these clips and turning over the chassis and axle the chassis is made suitable for right-hand sidecar attachment for Continental work. The whole is rigid in construction, and has the additional advantage of being light.

At the front end the body is supported in two places by coil springs on the outer side member. It is claimed that this somewhat unusual arrangement of springing provides exceptional comfort.

NEXT THURSDAY!
THE MOTOR CYCLE
SPECIAL SHOW FORECAST.
3d.

DOT SPORTS MODELS.

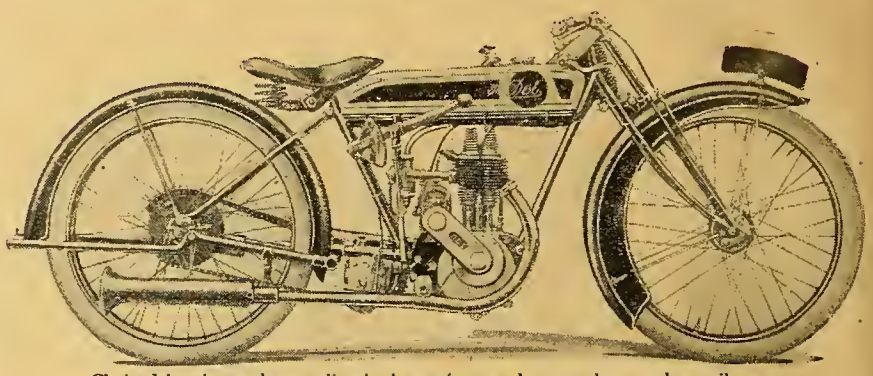
249 c.c., 348 c.c. and 976 c.c. Machines in Sporting and Touring Specifications.

UNDOUBTEDLY the most attractive models in next year's programme of Dot Motors, Ltd., are of the sports type.

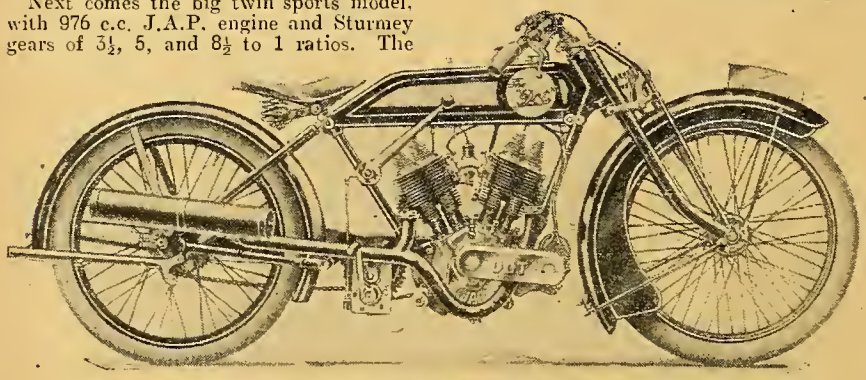
One is equipped with the 348 c.c. J.A.P. engine, and has all-chain drive through a three-speed Albion gear box, giving ratios of 5, 7, and 11 to 1. No kick-starter is fitted as standard, but a clutch is incorporated.

Both brakes are of the internal expanding variety. The handle-bar is attached directly to the head, and both front brake and clutch are controlled by inverted levers. A carrier is not standardised; tyre size is 26 × 2¾in. and the price is £78; a 249 c.c. J.A.P. engine model may be had at £75, and other alternative engines are the 349 c.c. o.h.v Blackburne (£80) and 349 c.c. Bradshaw engine (£78).

Next comes the big twin sports model, with 976 c.c. J.A.P. engine and Sturmey gears of 3½, 5, and 8½ to 1 ratios. The general specification is similar to that of the lightweight model, with, of course, 28 × 3in. tyres and other fittings in proportion. The frame has duplex tubes under the tank, and sidecar lugs, while the handle-bars are adjustably mounted on the head-clip. This model is priced at £140. Large silencers are a feature of these sports models.



Chain-drive, internal expanding brakes at front and rear and a very large silencer have been incorporated in the 350 c.c. Dot-Jap.



Designed for hill-climb and speed trial supporters: the sports model 976 c.c. Dot

Touring Dot machines embodying engines of the similar capacities are also to be produced, the same general specifications being maintained. The touring 976 c.c. machine costs £105, and a suitable sidecar brings the total cost of the outfit up to £130.

The touring lightweight has the 292 c.c. J.A.P. engine with three-speed Albion gear and chain-cum-belt drive, and the price is the very moderate one of £65.

A MOTORISED FRONT WHEEL.

Cykelaid Complete Power Unit and Spring Fork Attachment for Pedal Bicycles.

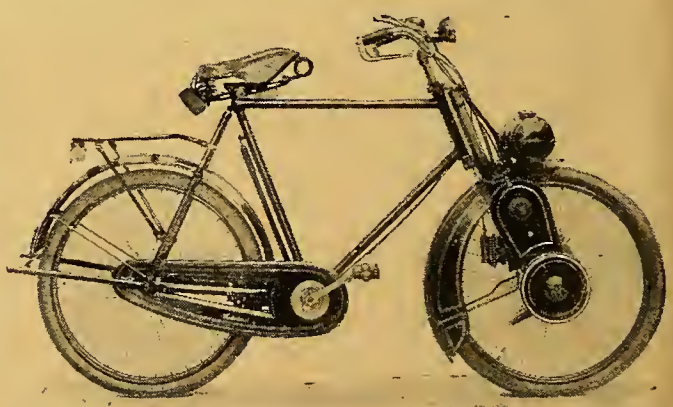
APPARENTLY the Sheppee Motor Co., Ltd., of York, has devoted more than an ordinary degree of logical thought to the problem of evolving a soundly designed motorised or motor-assisted bicycle.

Briefly, instead of applying power to the back wheel of the machine from an engine mounted in the frame (so subjecting the latter to many stresses which it was not designed to resist), a completely motorised front wheel and spring fork has been adopted.

The complete machine so laid out, or the separate attachment for use which an ordinary pedal cycle, is known as the Cykelaid, and was introduced to the public at the last Olympia Show, but, during the interval production has been delayed pending the development of the latest and much improved design.

A two-stroke engine of 55 × 56 mm. bore and stroke (133 c.c. capacity) is mounted on the side of the forks, ignition and lighting being provided by a Villiers' flywheel magneto. Transmission to the wheel is by chains throughout, *via* a handle-bar controlled cork-insert clutch.

Although a power-driven front wheel is not an innovation, its complete insulation from the bicycle by a sound and fairly heavy spring-fork is a feature likely to eliminate many of the troubles hitherto associated with this type of attachment, for the cycle is, in effect, merely towed, and bears little of the weight, and is subject to none of the torque reactions encountered when the power unit is fitted to any part of the original bicycle itself.



Engine, with tank, flywheel magneto and chain transmission is mounted on a heavy spring-fork to form the Cykelaid unit. The bicycle part may be any standard roadster; in this example 26 × 2 in. wheels are fitted

It is claimed that the weight distribution on the Cykelaid attachment is so good that the machine can be ridden with the hands away from the bars quite easily.

Speeds up to 30 m.p.h. are claimed—the tyres, incidentally, are 26 × 2in., and ball and roller bearings are used throughout. The price of the complete machine is £24 10s.

HARLEY-DAVIDSON LISTS 1,208 c.c. TWIN.

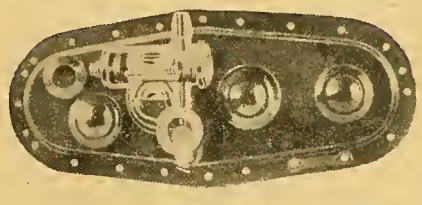
Improved Spring Forks. Roller Bearing Rear Hub. Double-seater Sidecar Available.

SUCH alterations which have been adopted in the latest model Harley-Davidson tend not only towards mechanical improvement, but add considerably to the comfort of the rider.

First, the brakes have been changed over, the toe-actuated pedal working an external contracting brake, which now has a band 1¼in. in width, with the result that its efficiency has been greatly increased, and the heel-pedal actuating an internal expanding brake.

Quite an important alteration has been made in the rear hub, which is now supplied with roller bearings suitably protected by two felt washers and two separate dust covers on each side. This hub has been tested by being run in liquid mud, and was not passed as satisfactory until it showed itself to be completely impervious to grit.

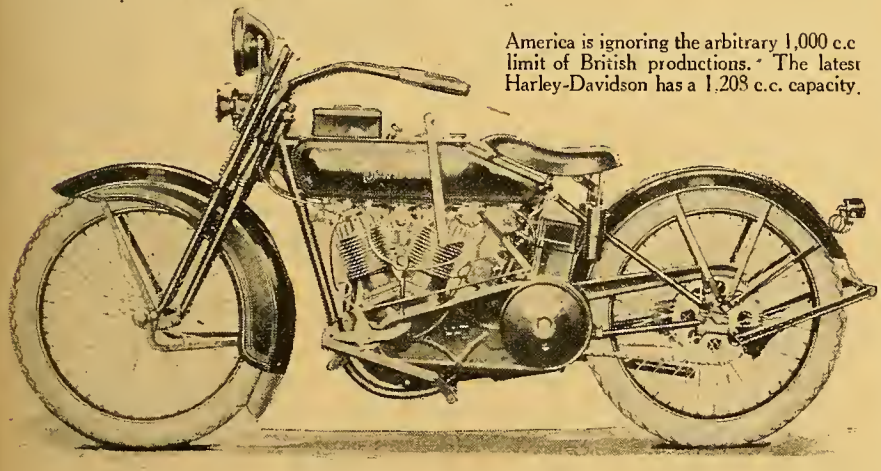
A small but important detail is the fitting of a hinged section to the rear mudguard, which can be thrown back merely by undoing a couple of nuts, thus



The mechanical oil pump is now a separate unit fitted outside the timing case.

rendering the tyre far more accessible, while it is well worth mentioning that the tail lamp is now carried on springs.

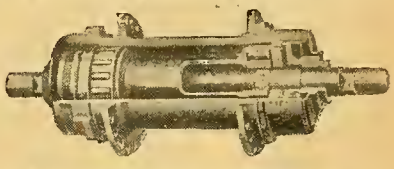
Good as was the method of controlling the engine switch in the 1922 model, a further improvement has been made for the coming season. This switch is now actuated by means of a key serving to safeguard the machine against theft, and should the rider omit to switch off there is a buzzer inside which tells him of his neglect.



America is ignoring the arbitrary 1,000 c.c limit of British productions. The latest Harley-Davidson has a 1,208 c.c. capacity.

Instead of embodying the oil pump in the timing gear case, it is now a detachable unit, bolted into position, so that it may be easily removed for the purpose of adjustment or repair.

No less than eight springs are used in the suspension of the 1923 pattern fork, and it should provide the maximum amount of comfort for the rider. Up to the present the Harley-Davidson spring forks have had only four springs, contained in the girders, but four extra ones have been added. The springs are carried between the fork members, and each main spring encloses a small auxiliary



Roller bearings are now employed in the latest pattern Harley-Davidson machines. The new hub is entirely water- and grit-proof.

spring, consequently no matter how rough the road it is impossible for the fork to bump.

Altogether the Harley-Davidson Motor Co., Ltd., will be marketing three separate types of machines: the 584 c.c. flat-twin (69.84 × 76.2 mm.), electrical equipment, £105; the 989 c.c. (84.1 × 88.9 mm.), £112 10s. with electrical equipment, or £107 15s. with magneto; the 989 c.c. sidecar model with electrical equipment, £139 15s., or the 989 c.c. sidecar model with mechanical horn and no lighting equipment £135. For £12 5s. extra the same models may be purchased with a 1,208 c.c. engine, while a double-seated sidecar of new design, in which the additional seat occupies the space usually taken by the back locker, can be had for £5 5s. extra.

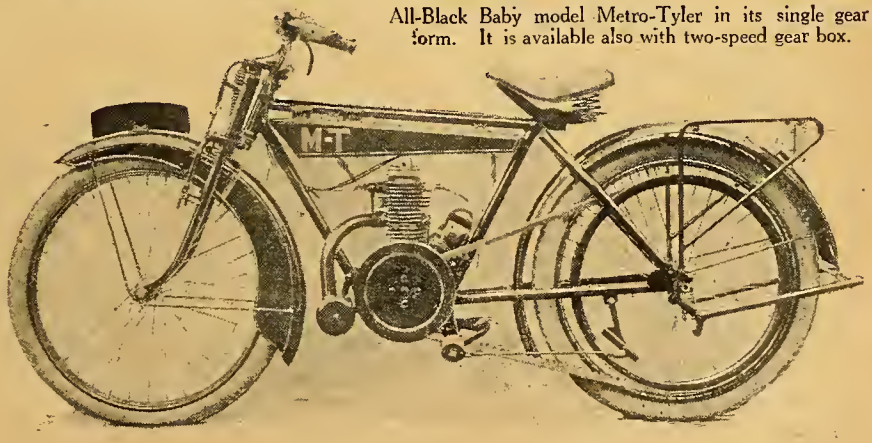
VARIED M.T. RANGE.

Two-strokes and Four-strokes in 350 c.c. Single Cylinder Class. Medium Weight Twin Retained. Puncture Sealing Compound Standardised.

SMALL alterations have been made in the Metro-Tyler 1923 programme, but mention must be made of a new model named the All-Black Baby, which is finished throughout as its name implies.

This machine will be obtainable in several different forms; as a single speed model to be sold at a very popular price, fitted with a 269 c.c. two-stroke engine, geared 7 to 1, and weighing only 120 lbs. If desired, it can be fitted with a two-speed gear at a small extra cost. The frame resembles that of previous year's models, but the engine is provided with plain phosphor-bronze bearings.

In the sports models, which are fitted with a similar type of engine (but equipped with a roller big end and ball bearing main shaft), some improvements have been made in the frame. The top tube is dropped at the rear, but a larger



All-Black Baby model Metro-Tyler in its single gear form. It is available also with two-speed gear box.

Advance Details of 1923 Models.—tank is supplied. This, too, may be available in several different forms; with a two-speed gear, clutch and kick-starter, or with a three-speed gear and all-chain drive. The weights range from 160 lb.

All the engines are fitted with an aluminium radiator on top of the cylinder, and a new type of decompressor, the spring of which is well away from the heat of the engine. The released exhaust gases pass into the exhaust pipe.

Other models will include a 348 c.c. overhead valve Blackburne engined type, with all-chain drive; and a 348 c.c. side valve model. The all-enclosed Metro-Tyler two-stroke, fitted with a roller bearing engine and with all the moving parts enclosed, is being retained without alteration, as is also the 698 c.c. Blackburne engined twin, which made its first appearance last year. This latter will be equipped with internal expanding brakes and all-chain transmission with a four-speed Jardine gear box.

All Metro-Tyler machines will be supplied, as standard, with Jackson's Impervo in the inner tubes and a positive guarantee against punctures for 4,000 miles is to be given.

A REAL ULTRA LIGHTWEIGHT.

Capacity 43 c.c. only in the Clement Bicycle; 350 m.p.g. Claimed.

IT was in the issue of *The Motor Cycle* for August 17th that we published a description of the ultra-lightweight Clement motor bicycle, which is fitted with a 43 c.c. engine (35 × 45 mm.).

So far as the unit is concerned there has been no alteration, but the machine itself has been built into three different models, one being a special racing pattern which is not intended for the market but is nevertheless interesting.

A Sports Model!

Outwardly the engine is absolutely standard, but it is fitted with a cylinder drilled at the bottom of the stroke, and has a very high compression. The machine to which it is fitted is to all intents and purposes a path-racing bicycle with dropped handle-bars, wooden rims, and Dunlop path-racing tyres.

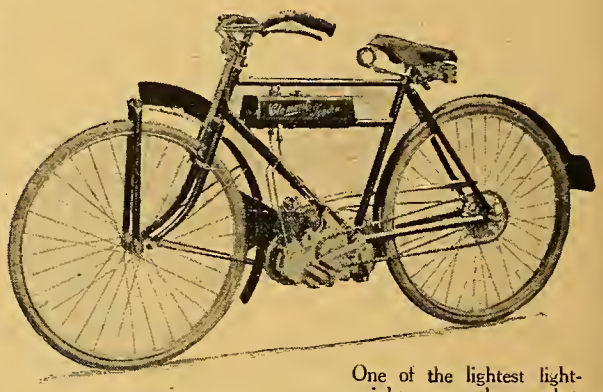
The cylinder follows closely the shape and type of that of the Gnome aero engine, while a miniature sparking plug of the type recently described in *The Motor Cycle* is fitted. The carburetter is of the one-lever variety following the lines of the Teutonic Pallas, while the magneto fitted at the rear of the unit is a Bosch.

An internal reduction gear is provided in the crank case, giving a ratio of 8 to 1, and this, with a slight reduction between the sprocket and the rear wheel, gives a total reduction of 12 to 1. To steady the engine in position two twin stays are fitted from a clamp on the down tube to the crank case.

In this racing model the oil breather is directed on to the exhaust valve so that the latter is cooled and lubricated at the same time.

So much for the racing model. The standard pattern is fitted to a bicycle which has a supplementary horizontal tube, the frame being composed of special tubing with welded joints. Details have been carefully studied, and owing to the microscopic size of the jet great care has been taken in filtering the petrol. There is a filter in the filler cap, another at the outlet from the tank just above the petrol pipe, and a third in the carburetter itself.

Another improvement is the fitting of a neat spring fork which is light, strong and efficient. The standard model has, of course, steel rims and 28 × 1¾in. tyres, while its price is £22 1s. A ladies' machine is sold at £24 3s.



One of the lightest lightweights on the market. The Clement machine with 43 c.c. engine. Later models will be equipped with a dropped top tube so as to lower the saddle position.

For this machine a consumption of 350 m.p.g. is guaranteed, and it is estimated that a 50 mile journey costs no more than 5d. The whole outfit is extraordinarily light and can be lifted about with ease. The petrol tank holds 2½ pints of petrol and ¾ pint of oil. It is claimed that 1 in 10 gradients can be climbed without pedalling.

The machine is built up in England at 26, Albany Street, London, N.W.1.

ALECTO PRODUCTION TO RECOMMENCE.

Three Two-stroke Models of 345 c.c., One for Sidecar Work.

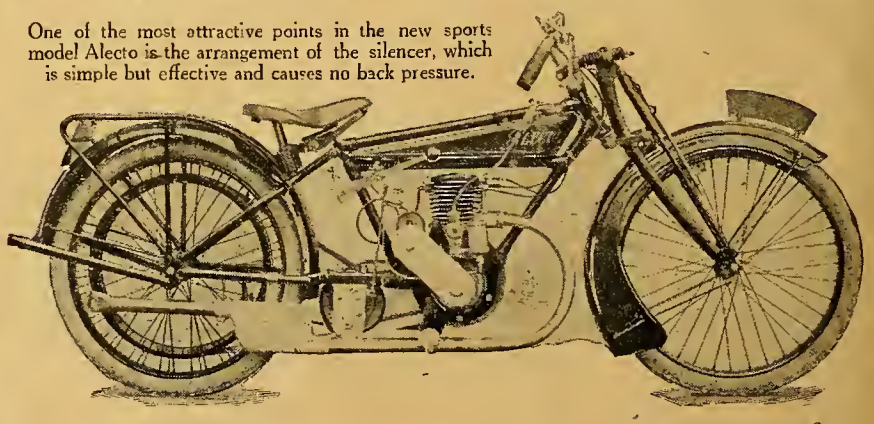
OF the various Alecto models which will again be placed on the market next year, perhaps the most attractive is the 345 c.c. two-stroke sports type, which, without tuning, is said to be capable of 50 m.p.h.

Complete System of Oil Ways.

From a sectioned engine, which we were able to examine at the makers' works, it is clear that the lubrication has received careful consideration. The oil is brought from a drip feed lubricator direct to the inlet pipe, whence, owing to the velocity of the mixture, an appreciable quantity is blown into the hollow gudgeon pin where it registers with the inlet port, thus lubricating it adequately. After lubricating the cylinder walls oil is collected in a well round the crank case baffle plate, whence it runs down specially cut channels to the main bearings, each of which is provided with double ball races.

An aluminium piston is fitted in which there are two rings at the top and a scraper ring at the base. The big end split bearing is lined with white-metal. The connecting rod is drilled, while in the small end the gudgeon pin is allowed a slight amount of movement, and it works also in the bronze bushed piston.

One of the most attractive points in the new sports model Alecto is the arrangement of the silencer, which is simple but effective and causes no back pressure.



Advance Details of 1923 Models.—
A large port is provided at the rear of the engine for the purpose of cleaning the transfer passages of carbon.

This engine, the bore and stroke of which are 76×76 mm., is fitted to all three Alecto models.

The weight of the sports model is 170 lb. all on, and the price, with a Burman two-speed gear box, £60.

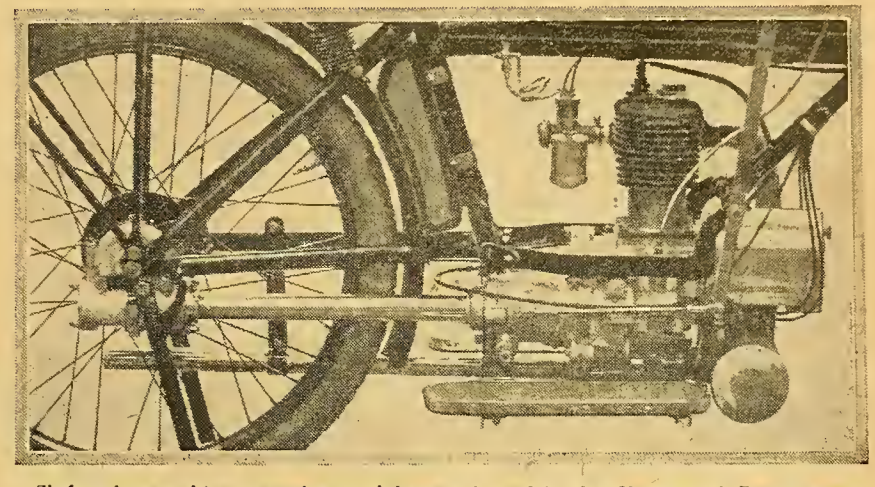
In the standard model a choice is given of chain-cum-belt or all-chain drive, or a two- or three-speed gear box, while the mudguards are 6in. across. These refinements are charged for as extras. Naturally, all models sold for sidecar use are fitted with three-speed gear boxes and chain transmission.

A notable improvement has been the fitting of a more spacious carrier, while behind the saddle tube is a tool box.

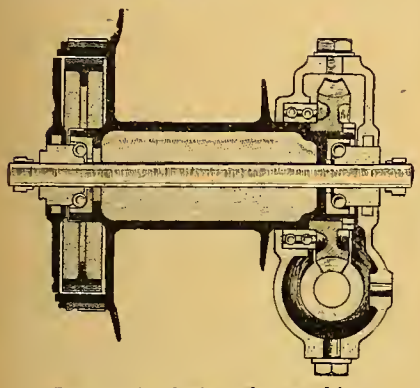
ANOTHER SHAFT DRIVEN SINGLE.

British Design Developed in France. Two-speed Gear and Worm Transmission.

A MEDIUM-WEIGHT motor cycle of 317 c.c., having a unit engine clutch and gear box, a propeller shaft and worm drive, has been designed by two English residents in Paris, Messrs. Claxton and Beatty, and, it is declared, will be put on the market shortly in both France and England.



Shaft and worm-drive, possessing novel features, is used in the Claxton and Beatty motor cycle, a nicely designed production of two Britishers in Paris.



Rear sectional view of worm-drive.

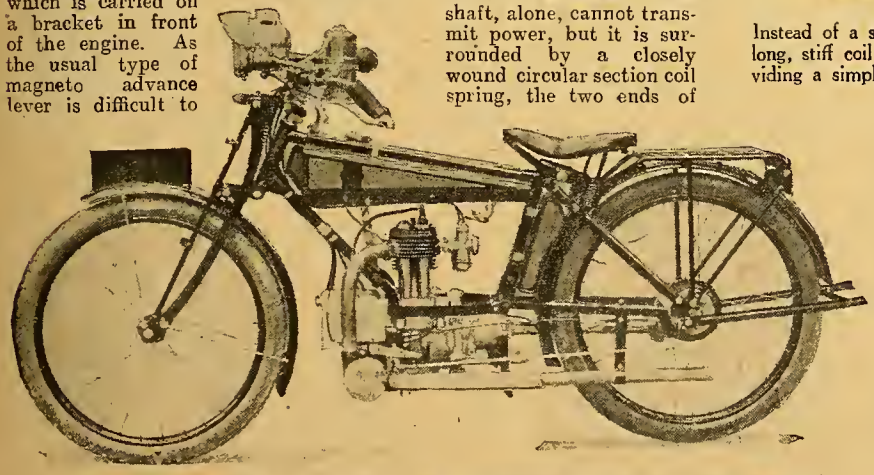
While the outstanding feature of this machine is the substitution of shaft and worm gear for the more usual methods of transmitting the drive, the engine is not without interest. It is a single cylinder of 70×76 mm. bore and stroke, with valves on one side. Hyatt roller bearings are used for the main shaft, while the big end has plain bearings. With a view to effecting protection from dust and mud, as well as easy cleaning, the valve stems are enclosed by telescopic sleeves and there is a particularly neat dust-proof aluminium housing over the magneto, which is carried on a bracket in front of the engine. As the usual type of magneto advance lever is difficult to enclose fully, use has been made of a rack and pinion with a Bowden wire control.

The engine is mounted on an aluminium crank case, which forms a unit with the clutch housing and the gear box. An eighteen-plate disc clutch is used, and immediately behind it is the two-speed gear box.

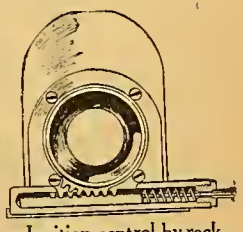
Hyatt roller bearings are employed for the gear shafts. From the gear box to the underslung worm on the rear wheel hub there is a propeller shaft with ball ends, one of which is received in a socket in the driving and the other in a similar socket in the driven member. The shaft, alone, cannot transmit power, but it is surrounded by a closely wound circular section coil spring, the two ends of which are screwed into and rigidly attached to the driving and the driven members. There is sufficient flexibility in the coil spring to take up all irregularities of the drive, as when running slowly or when starting away, and yet a perfectly rigid drive is secured when the engine is developing its full power.

An underslung David Brown worm is used, the efficiency of which is stated to be 95 per cent. Heavy radial and thrust ball bearings are used for the worm and the worm wheel, and the whole mechanism is oil-proof and dust-tight. The propeller shaft is enclosed in a steel tube, while the worm and worm-wheel run within an aluminium casting, the upper portion of which can be removed after withdrawing two studs.

Instead of a shaft proper the transmission is taken through a long, stiff coil spring, thus absorbing engine shocks and providing a simple universal joint. The ball-headed rod acts as a distance piece.



To the many advocates of shaft this French production will appeal. The engine is a 317 c.c. four-stroke.



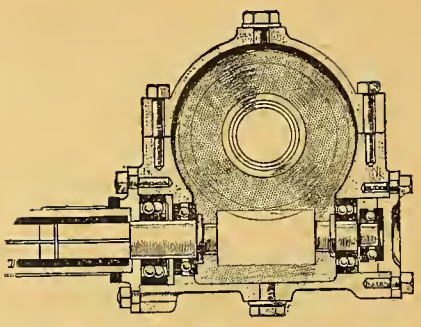
Ignition control by rack and pinion.

A drum on the rear wheel hub carries an internal and an external brake. Change of speed is effected by a lever on the right-hand side, with a gate giving

Advance Details of 1923 Models.—

two speeds and neutral positions. Among the features of the machine might be mentioned the exhaust pipe, the diameter of which is rather greater than that of the exhaust port, and the big capacity silencer mounted just ahead of the engine and under the magneto bracket. The exhaust is therefore got rid of with an absence of back pressure and without noise. The weight of the machine, fitted with 26 × 2½in. tyres, is just a little over 150 lb.

Some remarkable weight-paring must have been accomplished to bring the machine down to this exceptionally low figure, which, however, we understand, is only approximate.



Layout of bearings in the underslung worm-drive.

That a 317 c.c. machine with shaft transmission should even get under the 200 lb. limit proves that this form of drive need not necessarily be weighty. The unit engine and gear construction, of course, helps materially by eliminating primary chains, sprockets, and covers, but probably the greatest saving is in the shaft itself.

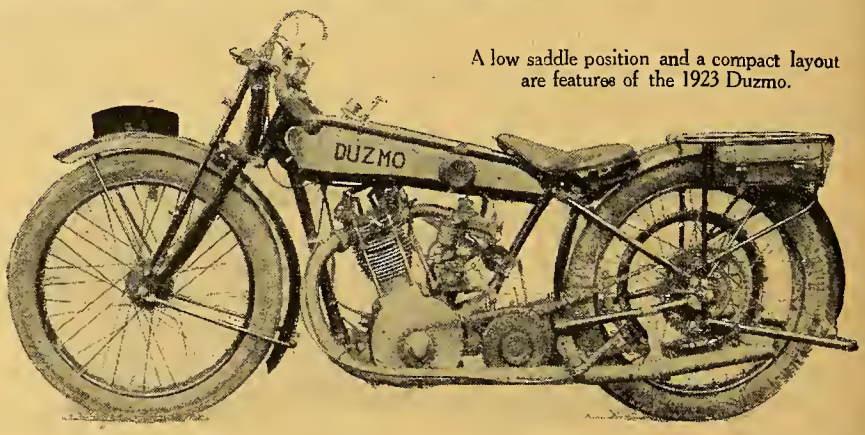
It is the intention of the designers to put this machine into mass production, and with this end in view they are having the drawings verified by machine tool makers and are preparing to lay down special machinery with a view to cheap production. It is stated that the motor cycle will be built both in France and in England, and that it will be marketed at a very reasonable price.

SOLO SINGLE FOR COMPETITION RIDING.

496 c.c. Duzmo with Inclined o.h.v. Engine and Close-ratio Gears.

FOR fast touring, competition work, or for use with a light sidecar the close ratio Duzmo is eminently suitable. Naturally, if employed for passenger work a different set of gear ratios would be required.

Fitted with a 496 c.c. engine (89×79 c.c.) tilted slightly in the frame, which is substantially constructed but of quite conventional design, and a three-speed close ratio Sturmey-Archer gear box, the machine has a pleasing and businesslike appearance.



A low saddle position and a compact layout are features of the 1923 Duzmo.

Overhead Valves in Detachable Head.

The actual model illustrated is the latest pattern, but owing to its having been prepared for Brooklands it differs from the standard model in one or two details, to which reference will be made later.

Overhead valves are fitted which are situated in the detachable head and are inclined to the extent of 30°. Machined all over internally, the head is semi-spherical and a very clean piece of work, as not only is its interior dead smooth and arranged so as to give a clear passage to the inlet and exhaust gases (1¼in. is the diameter of the exhaust outlet), but the exterior is heavily and scientifically finned, while an air passage is left beneath the top fin which bridges between the two valves.

Double Valve Springs.

Each valve is provided with two springs, while the rockers, mounted on brackets which are practically extensions of the holding-down bolts, have large bearing surfaces, and screw-down grease caps to ensure long life; they are kept up to their work by light return springs.

There are two sparking plug holes in the head, in one of which a fir cone radiator is fitted.

Other interesting engine parts are the aluminium piston, which has one deep ring, and the connecting rod, which is machined all over, is drilled for lightness and has a roller bearing big end; the gudgeon pin is ⅝in. in diameter, and Skefko self-aligning bearings are provided for the main shaft. Another important alteration is the increase of clearance between flywheels and crank case, which reduces oil friction.

Foot-operated Oil Pump.

While the model illustrated is fitted with a foot-operated oil pump delivering the lubricant through a drip feed, a Best mechanical lubricator is supplied to the standard model.

Binks rat-trap carburetters are fitted to all models.

The usual brake equipment is a Webb front brake and a rear pulley rim brake actuated by a direct pull pedal, but a Webb rear brake may be had.

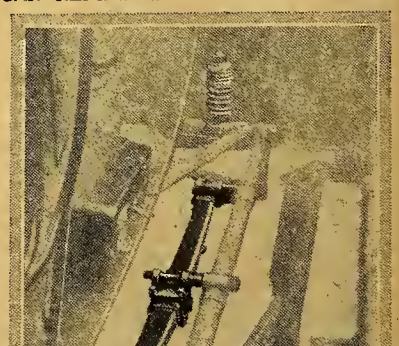
Brampton forks are supplied but modified by means of rubber blocks to the top springs, so as to stop "dithering" at high speeds.

In the machine illustrated it would appear that the silencing arrangements would be inadequate, and would invite the attentions of the police, but the standard model is provided with a silencer fitted to the end of the long exhaust pipe which is quite effective and causes no appreciable loss of power through back pressure.

The following particulars and dimensions will be of interest: Price, £100; weight, 220 lb.; wheelbase, 54½ in., ground clearance, 4½in.; and tank capacity, two gallons of petrol and half a gallon of oil.

Well thought out and bearing the mark of being designed by a practical rider, the new model Duzmo deserves popularity. John Wallace, Cedar Road Works, Enfield Highway, is the maker.

CAR REFINEMENT FOR SIDECARS.



Duco spring gaiters are now available for the springs of certain sidecars.

Here's Another Championship!

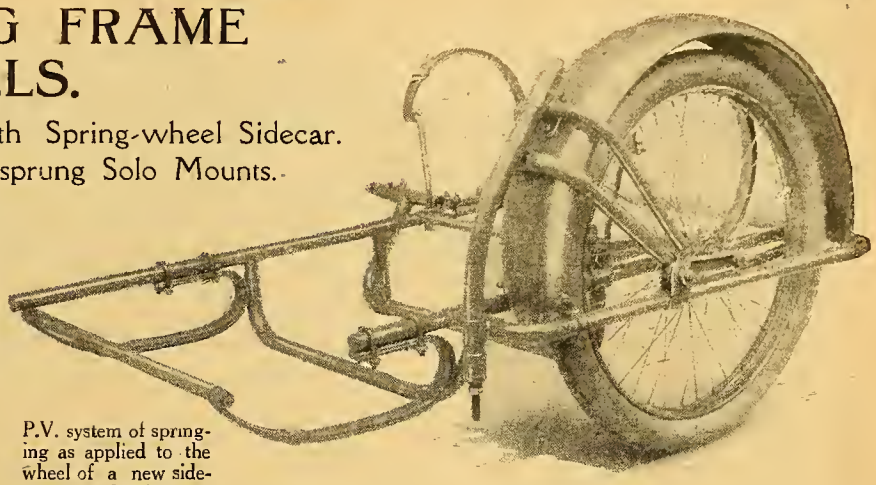
P.V. SPRING FRAME MODELS.

New 654 c.c. Machine with Spring-wheel Sidecar. Moderately Priced Fully-sprung Solo Mounts.

FOR next year the P.V. programme includes three popular models, fitted with a 250 c.c. Villiers two-stroke, a 350 c.c. Villiers two-stroke, and a 293 c.c. J.A.P. four-stroke. All are equipped with the simple P.V. spring frame, which is extremely satisfactory, having stood the test of time, and with a Burman two-speed gear, clutch, and kick-starter. The prices are: 250 c.c., £50; 350 c.c., £56; and 293 c.c. four-stroke, £60. Any one of these models can be supplied with a plain two-speed at £4 less or with a three-speed gear and kick-starter at £4 extra.

Next there are the *de luxe* models, of which the 350 c.c. model with B. & S. sleeve-valve engine and Burman three-speed gear is extremely attractive. It can, however, be had with a 349 c.c. J.A.P. four-stroke engine if desired.



P.V. system of springing as applied to the wheel of a new sidecar chassis.

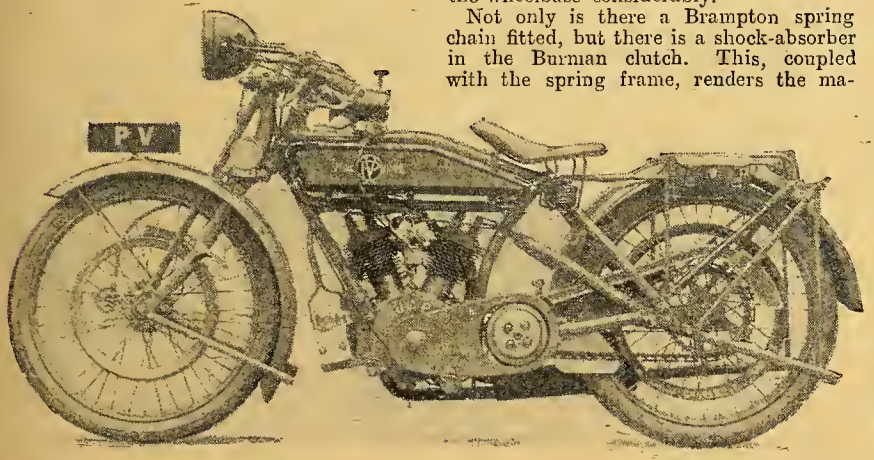
In these *de luxe* models the spring frame has been slightly modified, as the saddle tube containing the springs suspending the rear portion has been placed forward of the gear box, consequently shortening the wheelbase considerably.

Not only is there a Brampton spring chain fitted, but there is a shock-absorber in the Burman clutch. This, coupled with the spring frame, renders the machine extremely smooth, and the same method of transmission is employed in all three models, which have many details in common; for example, the excellent brake system, consisting of large shoes applied to dummy belt rims. It is also worth noting that customers are given a choice of carburetters.

Another interesting fitment which is supplied as a standard to these last three models is the Jackstand, which enables the machines to be jacked up with the minimum amount of effort, permits of easier access to the back tyre, and absolute rigidity when the back wheel is raised off the ground. Front stands are supplied to all these models, and an ingenious and absolutely secure form of stand clip which cannot rattle.

Prices of the *de luxe* models are: 350 c.c. with J.A.P. or B. & S. engine, all-chain drive, £76; 496 c.c. twin-cylinder J.A.P., £90, or with J.A.P. super-sports engine £95; the *de luxe* sidecar model, 654 c.c. twin-cylinder J.A.P., all-chain drive, £122.

The well-tested P.V. spring frame has been incorporated in the sidecar wheel most successfully, and the sidecar is undoubtedly one of the best sprung attachments obtainable.



496 c.c. P.V. *de luxe* model with B.T.H. ignition and lighting, which is supplied as an extra. This is one of the few small twins for 1923.

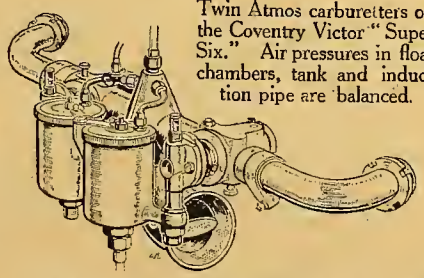
80 M.P.H. FLAT-TWIN.

Coventry Victor Refinements, Air-balanced Induction and Fuel System. Twin Carburetters.

A MOST striking model, the "Super Six," will bear the Coventry Victor name in 1923.

To all appearances the engine is similar to the standard flat-twin models, but it has a somewhat higher compression ratio than the standard, while the valve gear has been modified for speed purposes.

Two Cox Atmos carburetters are located near the centre of the induction pipe, and are connected by an ingenious balanced air intake. A funnel facing forwards may be entirely or partially closed by a butterfly valve; this not only facilitates starting, but is employed to control the amount of pressure present in the intake. Above this funnel is a cone-shaped body connected to each carburetter intake, and from the cone project three small pipes—one leading to the petrol tank, and one to the lid of each float chamber. By this means the air pressure is balanced throughout the whole petrol supply system.



Twin Atmos carburetters on the Coventry Victor "Super Six." Air pressures in float chambers, tank and induction pipe are balanced.

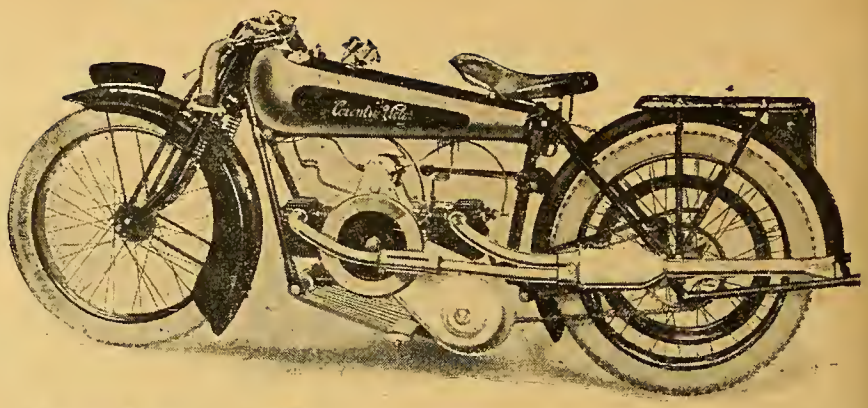
The frame follows normal Coventry Victor lines, having a duplex front down tube and bottom rails on which the engine rests. An imposing saddle tank covers the sloping top tube, and a cast aluminium underscreen is hinged at the front end, and functions also as a front wheel stand.

Transmission is by chain throughout, a Sturmey-Archer three-speed gear box with shock absorber, clutch, and kick-starter, being attached to the bottom

Advance Details of 1923 Models.—bracket. Long rubber grips are fitted to the somewhat flat bars, and reasonable mudguards (valanced in the case of the front) are employed to cover the 26×3in. tyres. This luxurious speed machine can be obtained with an 80 m.p.h. certificate at a slight extra charge.

Equally well finished, but slightly less ambitious in the way of performance is the standard sports model. In this case only one Cox carburetter is fitted, which lies behind the rear cylinder, the induction pipe having an ingenious air-tight expansion joint. Finished in grey, this machine is guaranteed to do 65 m.p.h.

Both these models are fitted with long exhaust pipes having a simple aluminium expansion chamber and fish tail near the back stays. The silencer is fitted with baffle plates and efficiently reduces the exhaust noise.



A *de luxe* flat twin. The 688 c.c. Coventry Victor model for which an 80 m.p.h. guarantee is obtainable.

ITALIAN UNIT CONSTRUCTION.

Twin Engine and Three-speed Box Integral in 600 c.c. V-twin Bianchi.

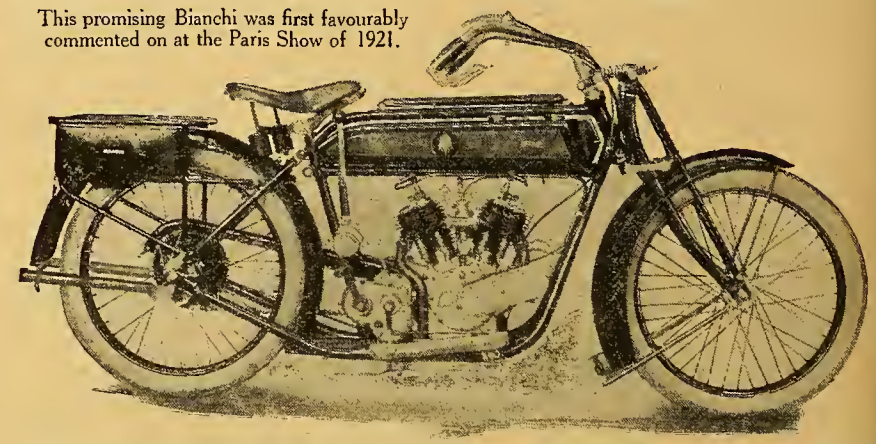
NO Continental country has made greater progress in motor cycle production than Italy, and one of the finest examples of Italian design is the 600 c.c. twin Bianchi, the external finish of which cannot fail to attract admiration.

Gear box and engine form a single unit, and the cylinder dimensions are 70×78 mm. bore and stroke (600 c.c.). Semi-automatic lubrication is provided, and the primary drive to the gear shaft is by three skew gears and a metal plate clutch, all running in oil.

Interchangeable wheels form another feature of the machine, the wheels being fitted with 26×3in. tyres. The mudguards are large and easily detachable, ample valances being fitted to the front guard.

A single-cylinder model, in which a Garelli pattern three-speed gear is incorporated, is another production of this firm. The engine is of 498 c.c. capacity,

This promising Bianchi was first favourably commented on at the Paris Show of 1921.



having a bore and stroke of 75 × 112 mm. The price of the twin-cylinder model is £150, and of the single cylinder £100. Bianchi Motors, Ltd., 26, St. James's Street, London, S.W.1, are responsible for the machine in this country.

VARIED ENGINES IN 1923 ORBITS.

Own Two-stroke and o.h.v. Sleeve-valve or Oil-cooled Four-stroke Models.

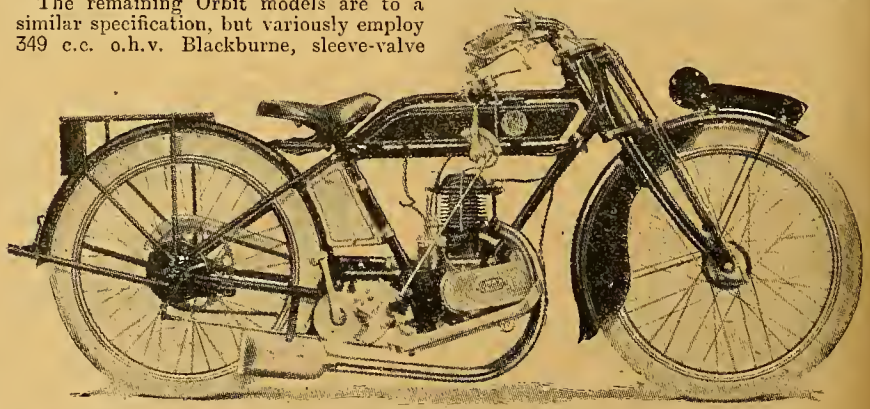
IN these days of proprietary units it is refreshing to find manufacturers of two-stroke lightweights building their own engines. There is a certain type of buyer with a rooted, albeit usually quite unreasonable, objection to assembled machines, and although many of the more important lightweight firms make their machines throughout, the majority of the smaller people patronise the proprietary unit.

Not so the Orbit, in its two-stroke form, anyhow. The 265 c.c. (68×72 mm.) engine, however, is quite conventional. Such details as a passage for the release-valve gases to the main exhaust pipe have received attention and the silencing arrangements for next year have been improved. A wide-swept exhaust pipe terminates in a large detachable silencer below the rear stay.

All-chain transmission *via* a three-speed Burman gear box is employed.

Other features are ample mudguarding, large footboards and a tool box on the saddle tube.

The remaining Orbit models are to a similar specification, but variously employ 349 c.c. o.h.v. Blackburne, sleeve-valve Barr and Stroud, or oil-cooled Bradshaw engines, thus meeting all requirements.



New silencing arrangements form the most important change on the two-stroke Orbit.

THE H.T. MOTOR CYCLE Co.,
PARK STREET,
Nr. ST. ALBANS,
Herts.

MINIATURE AND BIG TWIN COVENTRY EAGLES.

Introduction of Two New Models of Extreme Types. Reduced Prices All Round.

BY the addition of two extreme models to the Coventry Eagle range, there is a 1923 machine of this make of practically every capacity known. The newcomers are a 147 c.c. two-stroke miniature and a sporting big twin with the 976 c.c. super sports J.A.P. engine.

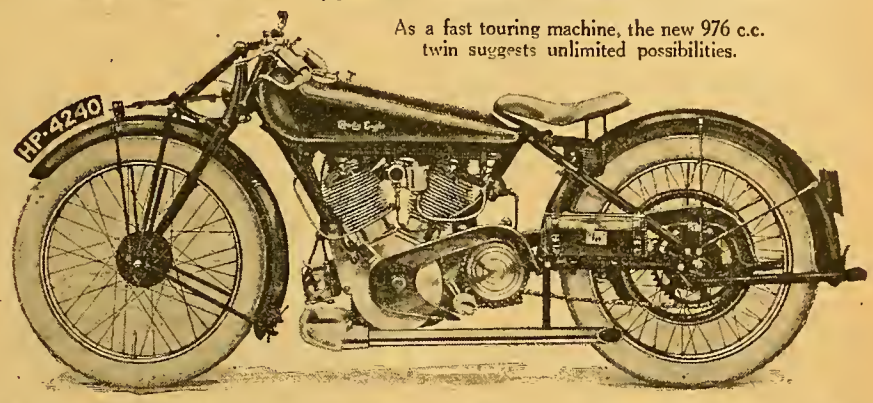
Prices of the two-stroke are £30 9s. single-geared, and £33 12s. with a two-speed box.

Compact Engine Housing.

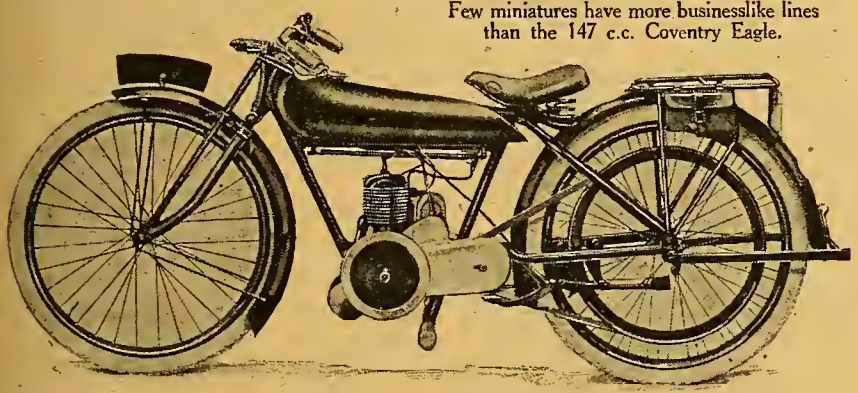
As might have been expected from the makers of motor cycles with the elegant appearance of the 1922 Coventry Eagles, the new big twin is particularly handsome and symmetrical. Furthermore, the way in which the engine is housed is exceptionally compact; a 5-in. ground clearance is allowed, although the saddle height is only 27in.

The finish is of the very finest, and, generally speaking, it represents remarkable value at £125. A suitable light sporting sidecar is marketed at £20.

One other addition deserves notice; it is a 349 c.c. side valve Blackburne-engined, chain-driven three-speed machine at £69.



As a fast touring machine, the new 976 c.c. twin suggests unlimited possibilities.



Few miniatures have more businesslike lines than the 147 c.c. Coventry Eagle.

The remaining Coventry Eagle models are retained without any alterations of note. Their prices, however, have been much reduced. For example, the 348 c.c. J.A.P.-engined utility mount—purely the maker's designation, for it is particularly pleasing in appearance—is now £72, although this figure does not include lamps, horn, etc., as last year. £19 buys a sidecar to suit either of the last-mentioned machines.

Dual-purpose Model.

A 550 c.c. J.A.P.-engined dual-purpose machine sells at £95 solo; and £115 with sidecar.

All the larger Coventry Eagle machines are, of course, fitted with the familiar bull-nosed saddle tank, introduced more than 12 months ago on the 250 c.c. o.h.v. sports lightweight.

SPRING FRAME RADCO LIGHTWEIGHT.

Novel Points in New Suspension System. New Chain-driven Model.

CHAIN-DRIVEN Radco two-stroke lightweights will make their first appearance at Olympia.

The new transmission is neatly carried out, and a most effective external contracting rear brake has been designed in conjunction therewith.

The 247 c.c. engine remains unchanged; but the tanks of all the models are now finished with a black instead of a silver-grey background.

During 1922 only the sporting model was marketed as a sidecar outfit; next year there will be a touring outfit as well.

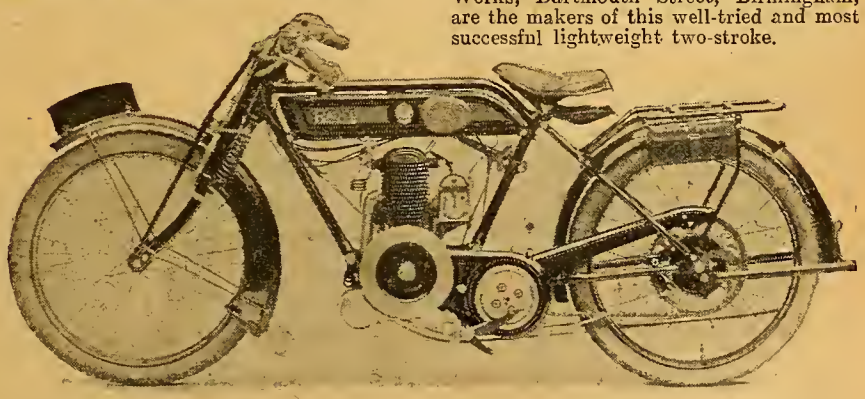
Brake Improvement.

On the remaining belt-driven machine the rear brake has been much improved; it now acts inside the V of the belt rim instead of outside, and the pedal and rod are considerably neater.

Wider mudguards and the substitution of footboards where footrests were previously fitted complete the list of changes to the various forms of the standard model.

Something quite new, however, is a spring frame Radco. It is novel by reason of the fact that the hinge occurs in front of the gear box and the two supporting coil springs are normally in tension instead of in compression. The design on the whole appears to have great possibilities, and not the least of its merits is its unobtrusive symmetry.

E. A. Radnall and Co., Vauxhall Works, Dartmouth Street, Birmingham, are the makers of this well-tried and most successful lightweight two-stroke.



Still another convert to chain drive is the Radco two-stroke, which also has a band type rear brake. This is the sporting model, which will be fitted with disc wheels as standard.

FRAME IMPROVEMENTS IN 1923 BRADBURYS.

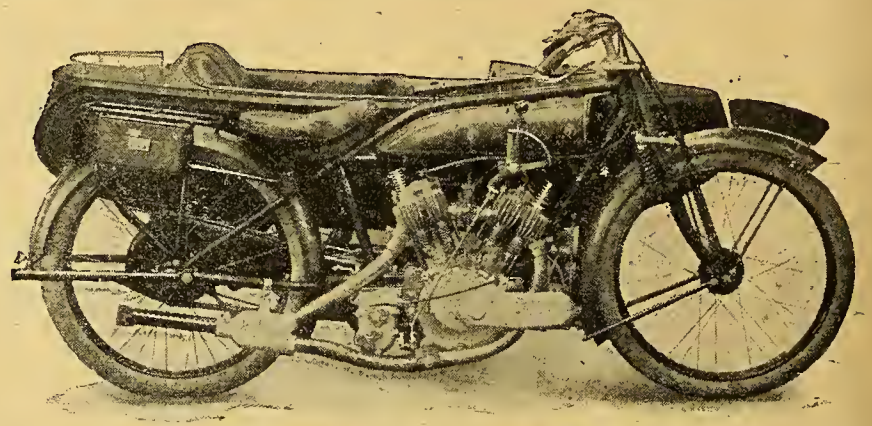
Old-established North Country Make Thoroughly Modernised for Next Year.

AFTER many years' honourable existence as a sturdy and reliable but not particularly handsome motor cycle, the Bradbury, in all its forms, has undergone a veritable transformation for next year.

It now compares favourably in the matter of appearance with anything else on the market, and recent records at Brooklands prove that sheer slogging capabilities are not its only commendable attribute.

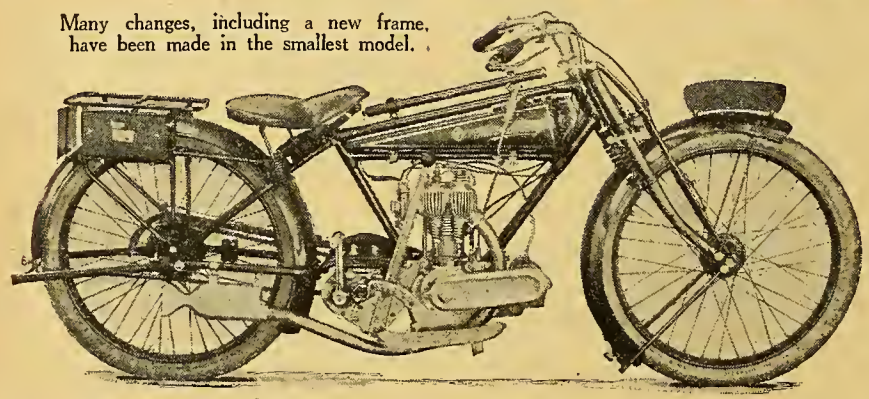
Three Main Models.

Three main models are offered—all side-valve four-strokes; a 350 c.c. single; a 554 c.c. single; and a 749 c.c. twin. In each case the engine is of Bradbury design and manufacture; in fact, except the gear box of the 350 c.c. model (a Moss three-speed), the whole machines are produced in the one factory.



Speedy lines are attained in the 749 c.c. Bradbury sporting sidecar outfit.

Many changes, including a new frame, have been made in the smallest model.



Chain transmission is employed throughout, light guards only being fitted in every case.

Each model is available as a sidecar outfit, but the big twin machine becomes a particularly attractive solo mount when turned out to a sports specification. A new frame of graceful design, well-curved exhaust pipes terminating in an aluminium silencer at the rear, and footrests instead of footboards, combine to make this model attractive to the most fastidious speed man.

Internal Expanding Brakes.

Internal expanding brakes on both wheels is a commendable feature of all the Bradburys for next year.

The makers are Bradbury & Co., Ltd., Wellington Works, Oldham.

350 c.c. MATCHLESS MODEL.

Range of Big Sidecars extended by Solo Medium-weight. A New Sports Twin.

MOST of the big sidecar specialists are turning towards the light solo machine as an addition to their range for the 1923 market.

In this class the Matchless concern must now be included, after long absence from the smaller solo field. The new model is engined by a 349 c.c. Blackburne side valve unit.

A Sturmey-Archer three-speed gear box, including clutch and kick starter, is fitted, and a drawbolt for the purpose of front chain adjustment is provided. And in this connection it must be pointed out that engine, gear box and magneto are assembled in a special cradle, which can be handled as complete unit.

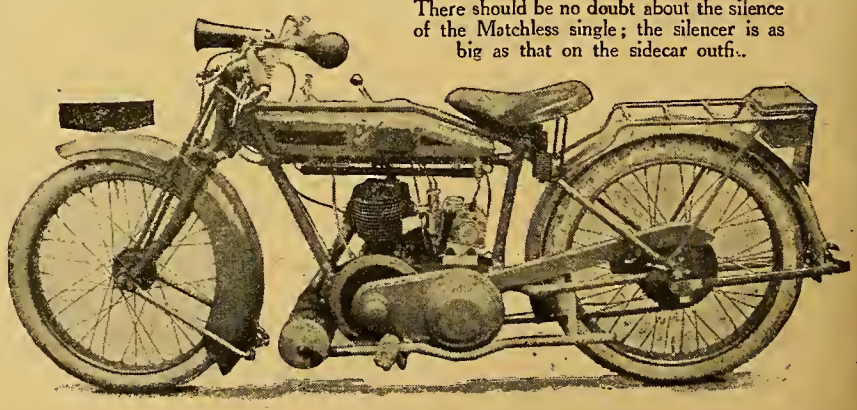
Above the gear box is the M-L magneto mounted on a sliding platform and provided with a suitable adjuster for the purpose of taking up any slack in the magneto chain.

Points of convenience have been carefully studied, kneegrips being fitted as a standard, and an excellent all-metal tool box situated on the rear of the carrier and fitting practically flush with the top thereof. A Webb brake is fitted to the front wheel and an internal expanding brake to the rear wheel, while the Binks two-jet semi-automatic carburetter forms part of the standard equipment.

If desired, a Lucas Magdyno can be provided at an extra cost. Both wheels have voiturette rims carrying 650×65 mm. tyres, and the weight is 220 lb., price £72 10s.

One new twin cylinder model will be introduced, to be known as the super-

There should be no doubt about the silence of the Matchless single; the silencer is as big as that on the sidecar outfit.



Advance Details of 1923 Models.—sports model J, equipped with a 976 c.c. super-sports J.A.P. engine, Sturmey-Archer three-speed gear box, clutch and kick starter, and 700×80 mm. tyres.

The other Matchless models will remain practically unaltered; all will be fitted with the standard Matchless three-speed gear box.

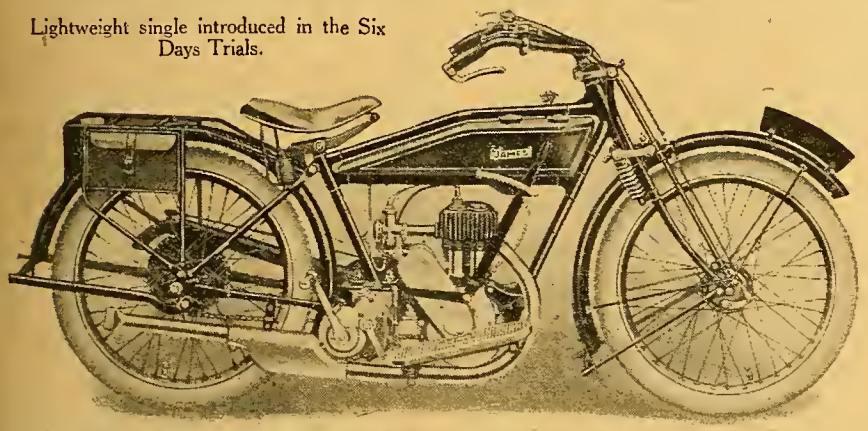
Small improvements have been made in the sidecars, there now being side shields to the windscreens, while a spring catch is fitted to the scuttle dash.

Prices of 1923 Matchless machines range from £110, 976 c.c. J.A.P. or M.A.G. solo to the luxurious model H with two-seated sidecar and J.A.P. or M.A.G. engine at £160 10s.

DETACHABLE HEADS ON 500 c.c. JAMES TWIN.

Detail Alterations only on the other Popular Models. Big Single no Longer Listed.

Lightweight single introduced in the Six Days Trials.



TWO of the James models remain practically unaltered; these are the 749 c.c. twin and the 350 c.c. four-stroke, which made its first appearance at this year's A.C.U. Six Days Trials.

The little two-stroke also has undergone but slight modifications, the most important being the adoption of all-chain drive with a two-speed gear.

Changes to the Solo Twin.

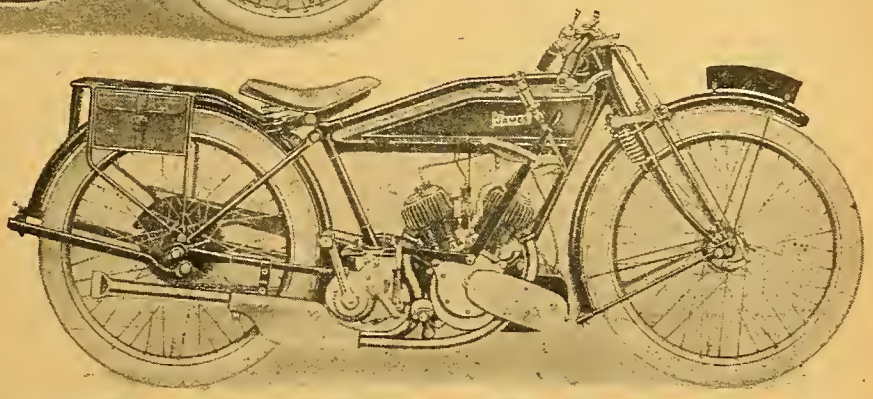
Considerable alterations, however, have been made to the 498 c.c. twin.

In the engine, aluminium pistons and detachable cylinder heads, held on by three studs, are fitted, the valves are of considerably larger diameter, and the magneto is in front instead of behind. A close ratio gear box, including clutch and kick-starter, will be fitted.

The frame also is entirely new, and closely follows the lines of that fitted to the 350 c.c. model, having a long slope in the top rail. Mounted in this frame is a tank which to all appearances is a unit, though the oil and petrol tanks are entirely separated, having double partitions in between. The rear wheel is quickly detachable, and larger exhaust pipes have been fitted.

Adjustable handle-bars clipped to the head lug have been standardised.

Those who favour the big single type of machine will look in vain for the James example, which has now been definitely abandoned.



Detachable cylinder heads, valves of large diameter and a new frame further improve the always attractive V-twin model.

MODERATE PRICED CHATER-LEA RANGE.

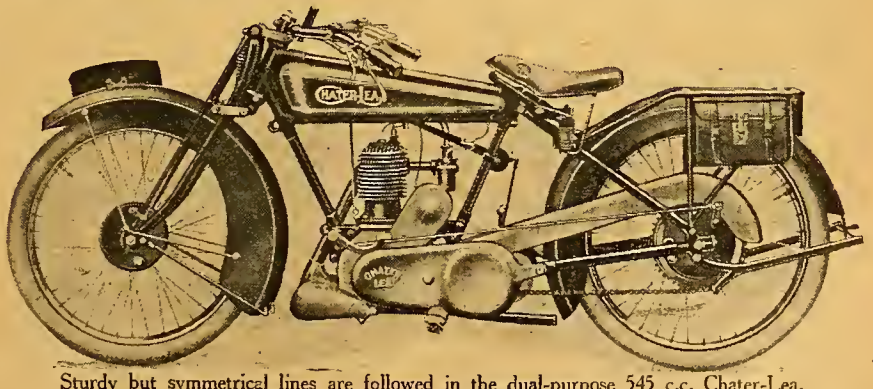
Big Single, Medium Single, Two-stroke and Big-twin Models for Solo, Dual-purpose and Sidecar Use.

TO those who are looking for a useful double-purpose mount the 545 c.c. single-cylinder Chater-Lea will undoubtedly appeal.

Its power unit is an engine made by the firm, and it is provided with all-chain transmission, a transmission shock absorber, and a Sturmey gear box incorporating a kick-starter, with the clutch controlled from the handle-bars.

Both wheels are interchangeable and detachable, while internal expanding brakes are fitted back and front. The price solo is £80, and with sidecar £100. The sidecar will not be sold separately.

Another new model is a 348 c.c. sporting solo mount fitted with an overhead valve Blackburne sports engine, all-chain drive, three-speed gear box, handle-bar



Sturdy but symmetrical lines are followed in the dual-purpose 545 c.c. Chater-Lea.

Advance Details of 1923 Models.—controlled clutch, kick-starter, and transmission shock absorber. As in the previous model, detachable and interchangeable wheels with internal expanding brakes are fitted. The price of this machine will be £72 10s., or fitted with a side valve Blackburne engine, £65.

Some small improvements have been made in the 269 c.c. Chater-Lea two-stroke, which has been considerably reduced in price, notwithstanding that it is fitted with a two-speed gear box. It is to be sold at £42 10s. without clutch, or £45 complete with clutch.

Little alteration has taken place in the popular 976 c.c. sidecar outfit, which is fitted with a 50° V-twin Chater-Lea engine, 85.5 × 85 m.m. (976 c.c.), with protected valve springs and enclosed valve lifter. It is a thoroughly practical mount which will take two or more people anywhere, and will be sold at £125.

FRICTION-DRIVEN MINIATURE.

Kenilworth Machine Now Fitted with an Infinitely Variable Gear.

IN spite of the fact that large numbers of scooter type machines have disappeared from the market, the little Kenilworth has met with success, and has proved exceedingly popular amongst its owners.

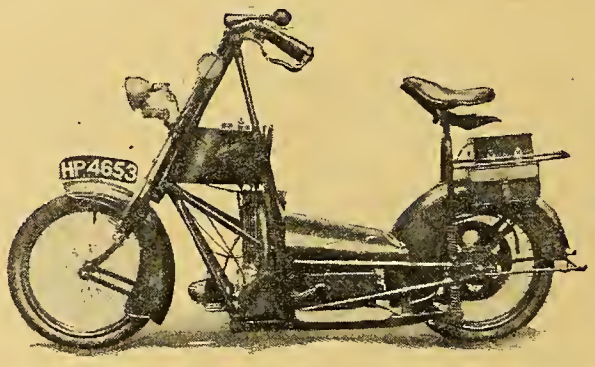
Originally the machine had primary belt drive to a countershaft, the final drive being by chain; only a single gear ratio was available.

Transverse Engine.

The engine is now set longitudinally in the frame, and the crankshaft carries a cast-iron flywheel at the rear end; against this flywheel bears a Ferodo-faced driven disc having a diameter of 7in. The disc is carried on a square shaft and supported in Skefko ball bearings, the final drive sprocket lying on the outside of the central bearing. Only a very light compression spring is needed for engagement.

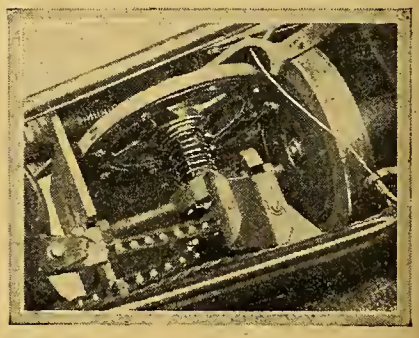
The whole friction gear is mounted in a cast aluminium case which also forms the engine bearer, and lies neatly in the standard Kenilworth frame.

So light is the operation of the gear that the control is effected by an ordinary carburetter air lever, and since the Vici single-lever carburetter is employed, the only addition to handle-bar fittings is a clutch lever.



(Left) One of he last of its class, the Kenilworth has been modernised for next year; the engine is now set transversely in the frame.

(Below) Disc drive variable gear replacing the primary belt drive.



Since the whole mechanism is enclosed it is unaffected by wet, and the friction gear is so efficient that it is possible to get away from a stand-still on a gradient of 1 in 9 with ease; the range of gear ratios available vary from 6 to 1 to 12 to 1.

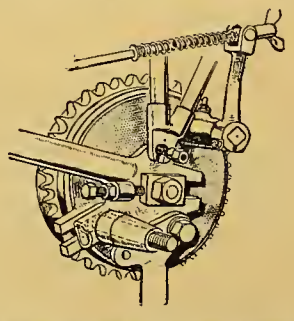
Propelled by a 142 c.c. o.h.v. engine (55 × 60 mm. bore and stroke), the Kenilworth is noted for its sturdy construction and sprung saddle pillar and foot-rests. It is a handy little machine, and in its latest form should make an appeal especially to ladies who require to travel short distances daily.

NEW IMPERIAL BIG TWINS.

Loop Frame and Engine-gear Unit Assembly. Sports Solo and Touring Sidecar Models. Internal Expanding Brakes.

AS forecasted in our last issue, two New Imperial big twins will be available next year, one a 976 c.c. sports model and the other a touring model of similar capacity. Both are fitted with J.A.P. engines.

In both cases, also, the engine and gear box are built up so as to form a unit which is held at three points in a sturdy loop frame, thus following the lines of the smaller New Imperial productions. Internal expanding brakes are fitted to both front and rear wheels, the latter having exceptionally wide shoes, while the anchorage for the brake is so arranged that it does not interfere with the quick detachment of the rear wheel. On the side of the plate is formed a heavy forked member which engages with a specially shaped stud head lying on the inside of the frame thus, when the wheel is withdrawn, the fork merely slides off its stop and can be easily replaced. Even this amount of trouble, however, should seldom be necessary, for, on the sidecar machine, the rear portion of the mudguard, complete with carrier, is quickly detachable by means of shouldered nuts



Rear brake and method of chain adjustment on the latest big twin.

locking into recesses in the carrier ends. The unit is self-contained and comes clear away from the machine, leaving three-quarters of the tyre fully exposed. A three-speed Burman box provides the necessary changes in ratio, chain-drive being employed throughout; a positive adjustment for the front chain is provided.

Grease-gun Lubrication.

Another most important detail is that forks, brakes, sidecar shackles, and practically every part of the machine is fitted with special nipples to take a screw-on grease gun. Timken roller hubs are fitted throughout, and a new sidecar chassis having five points of attachment evenly distributed over the frame is particularly sound in design.

When a Lucas magdyno is fitted it is carried behind the engine, and the specification of the touring model is very complete. Wide domed guards with guttered edges have been standardised, and knee shields can be fitted in addition.

In the case of the sports model somewhat lighter guards are, of course, fitted.

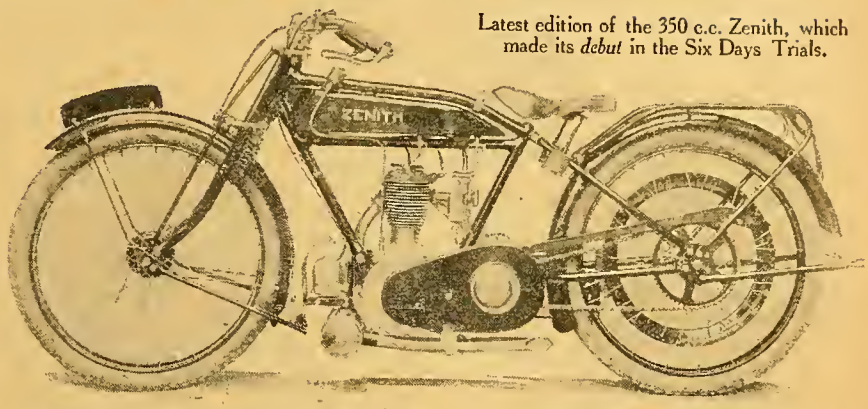
ALL-CHAIN ZENITHS.

350 c.c. Single, 500 c.c. Flat-twin and 1,000 c.c. Big Twin.

ONE of the most attractive features of the Zenith programme for 1923 is the 349 c.c. J.A.P.-engined medium-weight model. It has exceedingly graceful lines, and though it departs somewhat from previous Zenith practice, it is a pleasing-looking little solo mount.

This model is fitted with a Sturmey-Archer three-speed gear box having ratios of 5.9, 8.9 and 17.4 to 1, the control lever being carried on the gear box.

A Webb brake is fitted to the front wheel, while at the rear there is a compensating Zenith shoe brake applied to a dummy belt rim. Like other Zenith models, it depends for its ignition upon a Lucas magneto which is shielded from the wet by means of a guard. The price of this machine is £72, and its frame will take the 293 c.c. J.A.P. engine, price £66, and the 350 c.c. J.A.P. sports engine.



Latest edition of the 350 c.c. Zenith, which made its *debut* in the Six Days Trials.

Bradshaw Engine Improvements.

The Zenith-Bradshaw model, which attracted so much admiration at the Show last year, has undergone small but important improvements, but only so far as the engine is concerned, the latter being fitted with an improved valve mechanism. The rockers are now enclosed in an aluminium box, which, once filled with oil, will lubricate them almost indefinitely. New collars and cotters are fitted to the valves, while the springs are of the coil variety instead of being volute; the valve mechanism is more reliable and quieter in action. The price of this model is £95.

Despite the fact that most of the newest Zeniths are chain-driven, the famous Gradua model can still be had to order.

A new machine introduced this year is the 976 c.c. sports model, fitted with the super-sports J.A.P. engine. This also is a most attractive mount possessing graceful lines and an exceedingly strong duplex frame, constructed specially to stand rough work both at home and overseas. It has all-chain drive, Sturmey-Archer three-speed gear, and 28×3 in. tyres. The saddle tank is rigidly fixed, and is not only of large capacity but of pleasing appearance. Dummy rim brakes, incorporating a compensating mechanism, are fitted to both wheels.

Sidecar lugs are incorporated in the frame. The mudguarding has also been well thought out, the footrests are adjustable, and aluminium chain cases are fitted. It is to be sold at £125.

HENDERSON & AMERICAN-X IMPROVEMENTS.

Interchangeability of Parts a Feature. Low Prices for Complete Sidecar Outfits.

SEVERAL points of interest are to be found in the 1923 models of two famous American makers, the Henderson and American-X.

The former is now marketed as a "De Luxe model," a title which is not belied by the very comprehensive specification. The well-known four-cylinder power unit is, of course, retained, but has been mounted lower in the frame, so increasing the machine's tractability when used as a solo mount. A Zenith carburetter, incorporating a hot-air intake, and separate units for lighting and ignition, are fitted.

Transmission is *via* a gear box cast *en bloc* with the engine, giving three forward speeds (a reverse is supplied as an extra), and a heavy driving chain. A clutch of the multiple-disc type may be controlled either by hand or foot levers situated on the left-hand side.

A choice of two sidecars is offered—the standard model, supplied with step and apron, and the coupette model, equipped with a complete coupé hood and screen. Both types are mounted on a Millford chassis. Finished in deep blue with gold lining, the solo mount is priced at £137, while the standard and coupette sidecar outfits cost £163 5s. and £172 respectively with electrical equipment.

The American-X has a V-twin engine of 999.5 c.c. capacity. Automatic oiling, overhead inlet valves, and a Schebler carburetter are features of the power unit.

A three-speed gear box is neatly housed in the conventional position, and a dry plate clutch with hand and foot control is fitted. In addition to the well-sprung saddle and balanced plunger type front fork, 3½in. tyres should do much towards comfortable riding. The price, including electrical equipment, is £105. The sidecars obtainable are identical with those of the Henderson, the price of the outfits in this case being £131 5s. for the standard model, and £140 for the coupette. The finish is also identical with that of the Henderson, as are wheels, forks, handlebars, controls, and brake mechanism.

The two machines are distributed by Melchior, Armstrong, and Dessau (London), Ltd., 15, Newman St., Oxford St., London, W.1.

THE CALTHORPE PROGRAMME.

ALTHOUGH the Calthorpe motor cycle has been on the market for many years, for some reason it is not generally known that it is one of the comparatively few fitted with engines produced under the same roof as the machines themselves. In other words The Calthorpe Motor Cycle Co. is not an assembling firm, and for this reason greater interest attaches to its programme for the coming year.

The Calthorpe has always been a neat machine, and its evolution has been one of gradual improvement rather than of drastic changes and experiments.

For 1923 there will be three models. The first is a 250 c.c. single-speed machine at a popular price, which is the 1922 machine improved in all its details, and fitted with a C.A.V. magneto, a larger saddle, 26×2¼in. tyres, and a welded steel pannier bag.

Second on the list is a two-speed model, having an entirely new engine, which is said to develop considerably more power than the existing one. A Burman two-speed gear with clutch and kick-starter is fitted on a neat bracket instead of being cliped to the tubes of the back stays as the 1922 model. The tyres are 26×2½in., while the mudguards are 6in. D section over the rear wheel, and 5in. at the front.

The third model is the 350 c.c. sidecar outfit, a type of machine which the Calthorpe Company has done much to popularise. The engine fitted was one of the first, if not actually the first, two-stroke of 350 c.c. to be proved a practical proposition. For 1923 the model will have 26×2½in. tyres, and a sidecar with door and upholstered arms. Another addition to the existing model is a carrier which is equipped with a pair of pannier bags.

350 c.c. FOUR-STROKE TRIUMPH.

Side-valve Three-speed Model. Unit Construction.

THOUGH not altogether unexpected by the *cognoscenti*, it will come as a surprise to many to find that the Triumph name will now appear on a new side-by-side valve 350 c.c machine which will be staged at the forthcoming Olympia Exhibition, but will not be available for the public till April.

Almost every feature of the engine and gear unit, though unusual, is thoroughly practical, and there is hardly a detail that will not be of interest to the engineer.

The cylinder has a bore and stroke of 72×85 mm. (346 c.c.), and is a single iron casting having the valves at the side

Oscillating plunger oil pump on the new lightweight.

and the plug between the valve caps but somewhat nearer the centre of the cylinder. The shape of the head is unusual, in that almost the entire compression space lies in the valve ports, the piston reaching almost to the top of the flat head. This feature leads to a somewhat unorthodox appearance since the arrangement of the cooling ribs is, of course, modified to suit. The exhaust port is very well ribbed, but the actual inlet port casting is unribbed and tapers gradually from the carburetter to the valve.

Having a head diameter of 1½ in., the valves are somewhat raised above the floor of the ports; they are held down by very large diameter coil springs and are operated by cams lying side by side on a single sleeve. This sleeve rotates on a fixed spindle and is fed by oil under pressure, some of which is distributed through holes in the cams to the rocker gear.

An aluminium slipper piston having two narrow top rings is attached to the H-section connecting rod by a hollow gudgeon pin which floats both in the small end bearing and in the piston bosses. It is secured endwise by split rings.

In the crankshaft itself we came across a feature most unusual in four-stroke engines, in that this member is of the overhung type, having two bearings on the flywheel side between which lies the primary driving pinion. In actual practice the crankshaft itself bears only on the inner of these bushes, while the outer diameter of the flywheel boss provides the second bearing surface and is of very large proportions. The flywheel itself is bolted to this boss which, in its turn, is secured upon the splined end of the crankshaft.

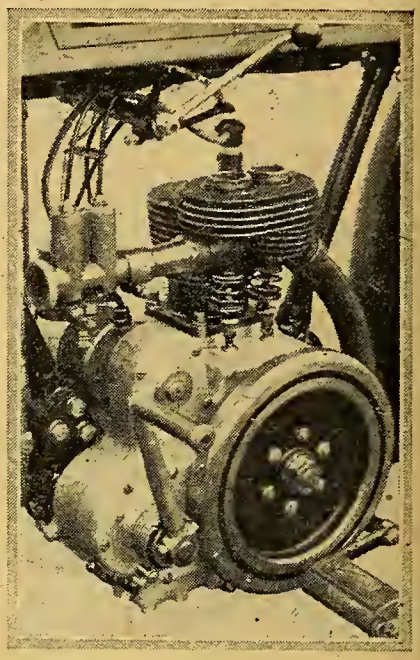
Advantages of Overhung Crank.

This unusual arrangement has several advantages inasmuch as the flywheel is readily detachable without special tools, while the boss provides an ample bearing surface, and, extending as it does close up to the primary pinion tends to prevent torsional oscillation of the shaft. It is possible, however, that a ball or roller bearing shaft will be substituted before the machine reaches the public.

Between the crankshaft and the gear shaft lies an intermediate pinion which is utilised to drive a most ingenious form of oil pump. In construction the pump is of the oscillating plunger type and is so constructed as to avoid external pipes.

Oil is delivered to the main crank bearings, the timing gear and the layshaft of the gear box.

Beside the absence of external pipes there are no valves proper employed in the lubrication system, the return from the engine and gear passing to a large well through a gauze strainer.

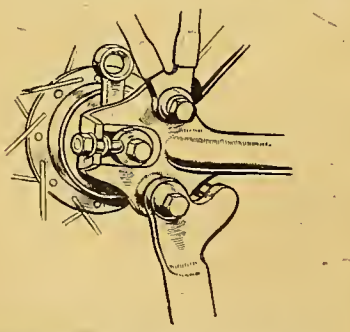


Combined engine and gear unit, with outside flywheel.

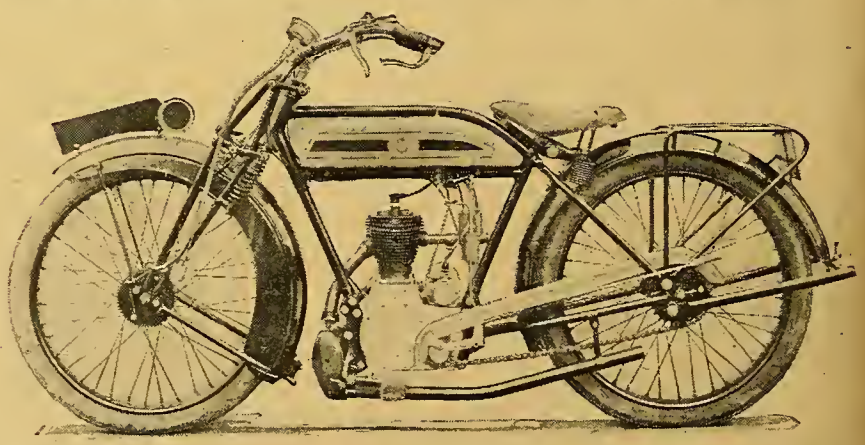
A metal plate clutch, with steel and copper plates, is mounted on the ball-bearing gear shaft, while the layshaft runs on floating bushes pressure-fed from the oil pump.

The design of the gear box follows existing Triumph practice, in that the gears begin to mesh before the wheels are locked to the shaft, thus insuring an easy engagement.

From the main shaft of the gear a bronze idle wheel carries the drive to an M-L magneto mounted directly behind the cylinder, and a kick-starter is, of course, incorporated with the unit.



Arrangement of the detachable wheel showing the extension to the distance piece.



Compactness and a short wheel-base are gained by the unit construction. Note the large cover plate giving direct access to the overhung crankshaft and big end.

Advance Details of 1923 Models.—

It might be considered that the long gear train would involve noisy transmission, but when the engine is running free the five gear wheels with which the magneto is operated are inaudible, a fact which may be attributed not only to excellent workmanship but to the system of lubrication.

On the side opposed to the primary drive projects the end of the gear shaft, on which is mounted the final drive sprocket and enclosed shock absorber.

The whole unit is very rigidly attached to a well-laid-out frame. All four engine plates are identical, as are the engine frame bolts; in fact, it is possible to attach the adjustable footrests on either front or rear cradle plates, according to the desires of the rider. The carrier and forks, also, have both sides of identical construction, the distance pieces, pivot bolts and links also being interchangeable. The smallest possible number of pin and nut sizes is employed.

Front and rear wheels are quickly detachable and interchangeable by the simple means of removing a knock-out spindle and short distance piece, the distance pieces being constructed with large eyes which may be easily reached for fitting and detachment purposes. Both wheels, also, are fitted with internal expanding brakes, and the drive is conveyed through a very simple form of dog teeth; a speedometer drive is incorporated with the front brake drum. As the knock-out spindle principle is used it is unnecessary to employ a full slotted fork rear end, and consequently the adjusting draw bolts are without loose end pieces, the ends of the rear fork being turned over to form an abutment.

Front springing is of the new Triumph-Druid type, and the mudguards are remarkably sensible, being the same as those employed on the S.D. model. A large expansion chamber lies in the front of the crankcase.

Weight distribution has received considerable attention, and the centre of the unit is also the centre of the frame, while the saddle is as far forward as is reasonably possible.

HAWKER BIG SINGLE.

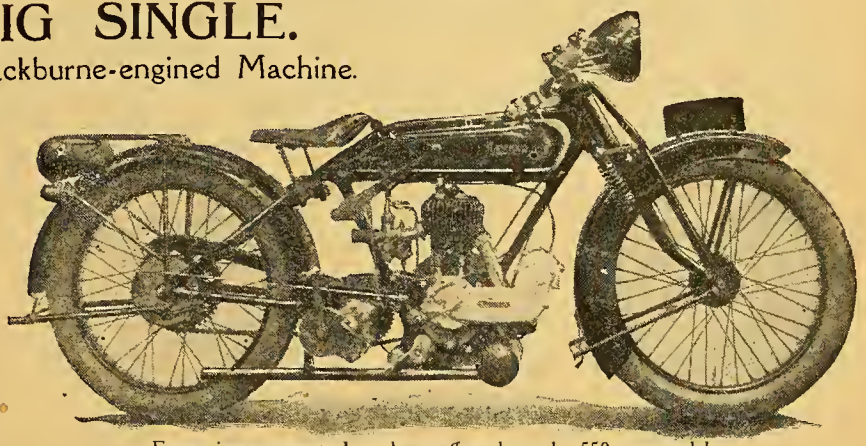
Double-purpose 550 c.c. Blackburne-engined Machine.

CONSIDERABLE alteration has been made in the frame of the 550 c.c. Hawker, which is now more symmetrical in design. The top tube is curved to the rear, which, it has been found, has resulted in steadying the steering of the machine, for the saddle is now within 28 ins. of the ground. Druid forks are used.

For Sidecar Work.

Sidecar lugs are incorporated in the frame, which, incidentally, will take all Blackburne engines.

The engine is of standard Blackburne pattern, with detachable head, outside flywheel, and roller bearing big-end. Best and Lloyd lubricator, Fellows magneto, Amac carburetter, and either a Lucas Magdyno or B.T.H. Sparklight as an extra for lighting equipment, are fitted. The transmission is by exposed chains which are guarded on the top run.



Frame improvements have been effected on the 550 c.c. model.

It is equipped with a Burman three-speed gear box, and 650×65 mm. tyres on flat base rims. Solo it is sold for £80, or with a Montgomery sporting sidecar at £95.

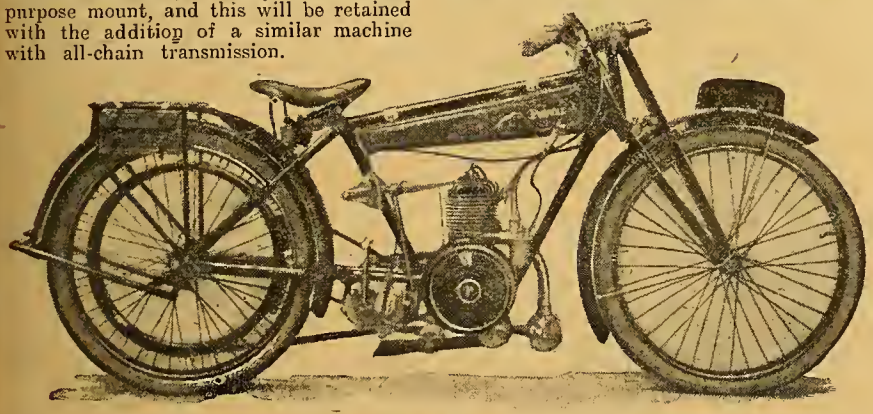
The 348 c.c. model is sold at £70. There is also a 348 c.c. overhead valve Blackburne sports machine, fitted with a close-ratio gear box and narrower mudguards.

INTRODUCTION OF A POWELL LIGHTWEIGHT.

Serviceable Solo Two-stroke at a Moderate Price. Chain-driven 547 c.c. Model.

IT comes as a surprise to learn that the makers of the Powell are introducing a lightweight for next year. Hitherto, of course, there has only been one Powell model, a sturdy 547 c.c. dual-purpose mount, and this will be retained with the addition of a similar machine with all-chain transmission.

The lightweight is a straightforward and simple design, embodying a 247 c.c. Villiers engine, and, in two cases, a two-speed Albion gear box, in a neat frame not unlike the larger type in general contour. Single-geared, it is priced at £36, with plain two-speed at £42, and with two-speed, clutch, and kick-starter at £45.



Villiers engine and Albion gear box as fitted to the Powell lightweight.

Considerable reductions have been made in the prices of the 547 c.c. Powells, which are now: £87 10s. with final belt drive, £90 with final chain drive, and £110 chain-driven with sidecar.

The inclined engine, with outside flywheel, detachable cylinder head, and very complete lubrication system, is practically unaltered.

Powell Bros., Cambrian Iron Works, Wrexham, is the address of the makers.

"THE MOTOR CYCLE" FILM

Will be screened Three Times Daily at THE BROADWAY CINEMA, HAMMERSMITH,

For one week commencing Nov. 27 (Show Week).

After this date the film will be released to the Clubs for their Cinema Nights during the winter months.

OIL-COOLED SHEFFIELD HENDERSON.

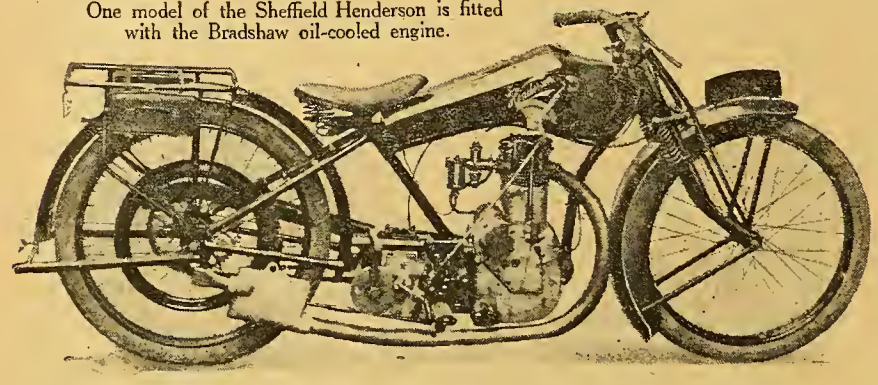
Range of Side and Overhead Valve 350 c.c. Machines Augmented by a Bradshaw Engined Model.

FOR next year the Sheffield Henderson range will be augmented by a model fitted with the 349 c.c. oil-cooled Bradshaw engine.

The newcomer otherwise follows the now familiar lines of this successful Sheffield make, and is particularly recommended for sidecar work. With Burman three-speed gear box with clutch and kick-starter it represents excellent value at £72.

Excepting detail improvements in mudguarding and silencing, the side-valve 349 c.c. standard and sports models (identical with the machine that scored top marks in the 350 c.c. class in the Six Days Trials) remain unchanged. The price in each case has been reduced to £72.

One model of the Sheffield Henderson is fitted with the Bradshaw oil-cooled engine.



Druid Forks Standardised.

Druid forks are now fitted to the 70 m.p.h. o.h.v. model, which incidentally was one of the first machines to be sold with a speed guarantee. The price of £90 includes this guarantee, and a spare standard piston and cam for touring work. Without the speed guarantee and fitted with a cast-iron or an aluminium piston, it costs £5 less.

All the Sheffield Henderson machines for next year are in the 350 c.c. class, and all employ chain transmission *via* Burman gear boxes.

The makers are Henderson Motors, Ltd., 73, Fitzwilliam Street, Sheffield, who also manufacture the well-known sidecars of the same name.

SLEEVE-VALVE OR OIL-COOLED ENGINES.

B. & S. or Bradshaw Engines in 1923 Coventry Mascots. Watersplash-proof Exhaust Pipes for Trials Riding.

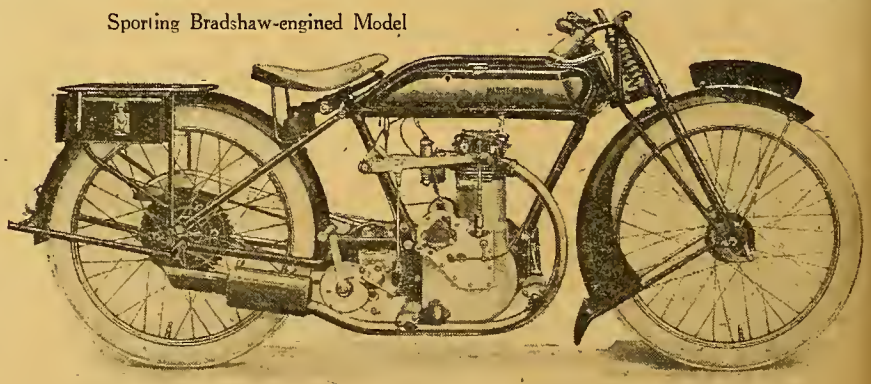
FIRST to adopt the Barr and Stroud sleeve-valve engine in Coventry, the makers of the Coventry Mascot continue to pioneer in a small way by introducing for 1923 a very similar machine fitted with the oil-cooled Bradshaw engine (349 c.c. single).

Frame design has been improved, and aluminium chain covers replace the metal guards hitherto used.

One Sports model using the B. & S. engine is notable for its silencing arrangements, which have been expressly designed for trials riding and watersplashes, the final exhaust exit being up in the neighbourhood of the rear tool bag. Chain-driven, with three-speed Sturmey or Burman gear box, this machine is priced at £72; or with a Bradshaw engine and more normal exhaust arrangements at £69. A similar touring B. & S. model is £72, or with final belt-drive and a two-speed gear box, £67.

The Coventry Mascot Cycle Co., Camden Street, Coventry, are the makers.

Sporting Bradshaw-engined Model



ANOTHER NEW LIGHTWEIGHT.

THREE new small two-stroke models will appear in the near future; they are manufactured by Coventry Bicycles, Ltd., of Gosford Street, Coventry.

Two of these are of the pedal-assisted type—one having a diamond frame, the other having an open frame suitable for ladies; the third is a miniature motor cycle having a similar engine but fitted with a two-speed gear and clutch instead of a pedalling gear.

The engine will have a bore and stroke of 60×60 mm. (170 c.c.), and the tiny motor cycle will be known as the "Wee McGregor."

The same firm will produce a medium-weight machine with B. and S. sleeve-valve engine and a three-speed Burman gear with all-chain drive. It is to be known as the Coventry B. and S.

Although these machines may not be exhibited at the Olympia Show it is likely that they will be available for inspection in the vicinity.

The 1923 models of over 30 manufacturers are detailed this week. Next week's issue will be a complete forecast of the exhibits at the forthcoming motor cycle show.

REMEMBRANCE DAY AT BROOKLANDS.

Indian, A.J.S. and Matchless-M.A.G. Wins at Well-attended Combined Meet.

REMEMBRANCE Day was celebrated at Brooklands by an afternoon's brisk racing, under the joint anspices of the B.A.R.C. and the B.M.C.R.C., three of the handicaps being for motor cycles.

The profits of the meeting went to Earl Haig's Fund, which was further helped by the auctioning of a painting of the track, bought by Mr. A. F. Millano for 27 gn.

Large Entries.

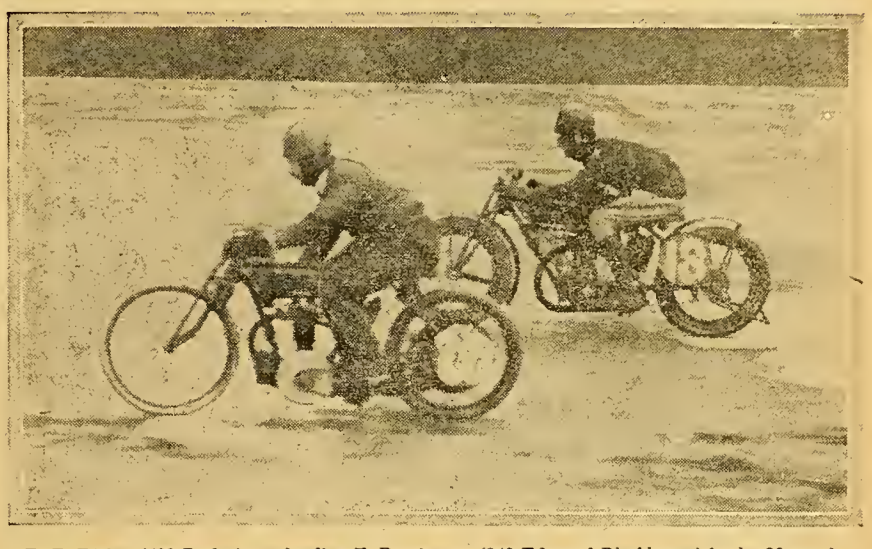
The field for the first race, a three lap all-comers passenger handicap, was so big that the track at the new starting line opposite the 2s. 6d. grand stand was barely wide enough to allow everyone to line up simultaneously. For one lap the limit men retained their advantage, but next time round E. A. Bridgman (998 Indian sc.) had overtaken half the field and, barring accidents, seemed likely to win easily. This he did.

ALL-COMERS PASSENGER HANDICAP.

		Handicap.
1.	E. A. Bridgman (998 Indian sc.) ...	57s.
2.	J. W. Jelpke (348 Weatherell sc.)	2m. 48s.
3.	L. F. Peaty (349 Hawker sc.) ...	1m. 45s.

Winner's speed = 68.3 m.p.h.

Another large and varied entry contested the Addlestone 70 m.p.h. solo handicap, and before all the back-markers had been started, C. T. Ashby, on one of the latest sporting Woolers, hurtled through on his second circuit so unexpectedly soon that the track had not been cleared of stray "pushers-off." The pace was too hot, however, and it was left to F. A. Longman on an o.h.v. A.J.S. to win a very fine race, to the great delight of the spectators who follow favourites. Prestwich, who was second, nearly lost his place by riding under a wrong number.



R. E. Dicker (499 Rudge) overhauling E. Remington (348 Edmund-Blackburne) in the 90 m.p.h. solo handicap.

ADDLESTONE 70 M.P.H. SOLO HANDICAP.

		Handicap.
1.	F. A. Longman (349 A.J.S.) ...	1m. 12s.
2.	J. V. Prestwich (248 New Imp.-Jap)	1m. 54s.
3.	V. G. Tucker (490 Norton) ...	1m. 21s.

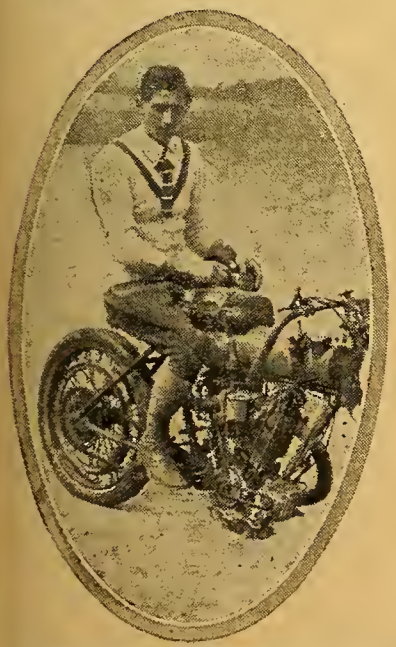
Winner's speed = 74.68.

As a fitting wind-up to motor cycle racing for 1922, the final event both was full of thrills and provided an extremely popular winner. Rumours that he had been lapping at nearly 80 m.p.h. made R. E. Dicker (499 Rudge) a hot favourite, but it was very quickly realised that R. O. Lowe (490 Norton), who started level with Dicker, was to make a game fight of it. For two laps these two struggled neck-and-neck, rapidly pulling to the front, but right on the final circuit O. M. Baldwin showed what his old Matchless was really capable of by overtaking the two singles and winning at nearly 90 m.p.h.

WEYBRIDGE 90 M.P.H. SOLO HANDICAP.

		Handicap.
1.	O. M. Baldwin (992 Matchless) ...	6s.
2.	R. E. Dicker (499 Rudge) ...	1m. 15s.
3.	R. O. Lowe (490 Norton) ...	1m. 15s.

Winner's speed = 89.1 m.p.h.

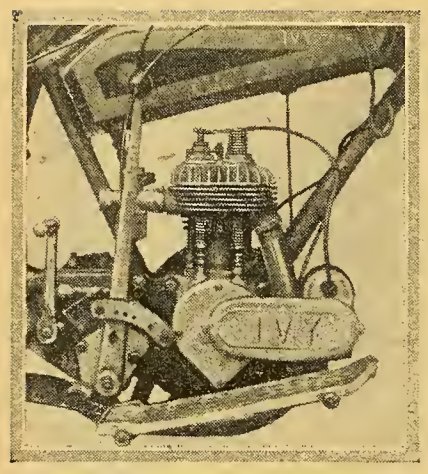


O. M. Baldwin (992 Matchless-M.A.G.), winner of the fastest race, at nearly 90 m.p.h.

E. Bridgman (998 Indian sidecar), winner of the sidecar handicap.

F. A. Longman, who won a race on the latest o.h.v. A.J.S. at 74·7 m.p.h.

CURRENT CHAT (continued from p. 696)



NEW FOUR-STROKE ENGINE. Described last week, the four-stroke Ivy is a clean, efficient-looking design. The timing case may contain a mechanical oiler.

1923 Prices.

£70 has been fixed as the price of the 350 c.c. Martinsyde touring model, described on p. 697; the sports model costs £72.

The price of the 350 c.c. Beardmore-Precision described in our last issne is not yet fixed; it was incorrectly given as £75, hnt it will be much lower than this figure.

The following is a list of Metro-Tyler prices for 1923: 269 c.c. two-stroke sports model, £46 4s., with clntch and kick-starter, £49 7s.; all-enclosed model, £54 12s.; All Black Baby (269 c.c.), £35 14s.; 348 c.c. four-stroke, £58 7s., with chain drive, £64 1s.; 348 c.c. o.h.v. speed model, £79 16s.; 698 c.c. sports three-speed, £94 10s., with four speeds, £97 13s.

Olympia!

Only nine more days and Olympia will once more open its doors as a motor cycle exhibition.

London-Exeter Arrangements.

Entries have already begun to flow in for the London-Exeter run, and forty were received within the first three days after the publication of details. November 20th is the last day on which intending entrants may send application forms for membership to the Secretary (Mr. Southcomb May, 34, Gower Place, London, W.C.1). The actual entries close on December 9th. Early entries have early numbers in their class.

Some improvement has been made in the arrangements at Exeter, and there will be a special breakfast at the garage, which will be in the hands of an experienced caterer.

To reach the new hill on the return journey, White Sheet, a *détour* will be made from Bridport to Beaminster, rejoining the course at Dorchester.

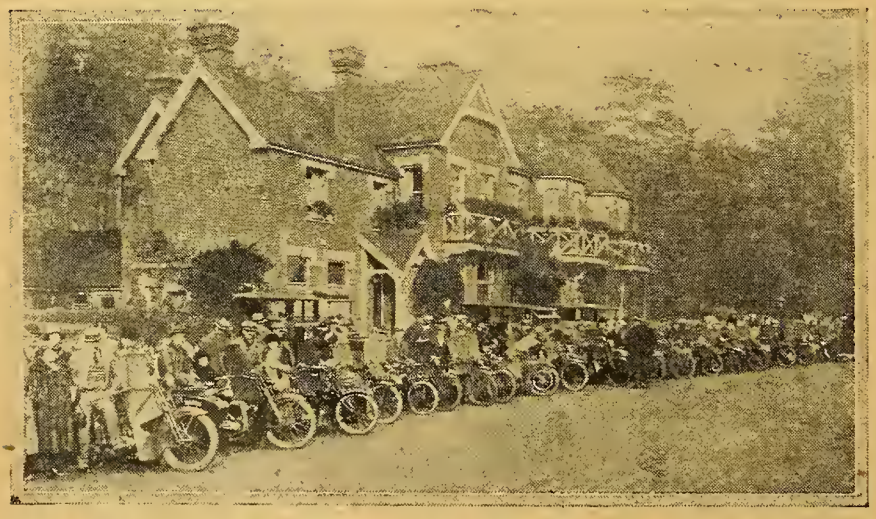
Imports and Exports.

There is an increase of 50% in the October imports compared with the returns of the previous month, and a slight increase against last year's figures. The number of machines imported was 93.

	1920.	1921.	1922.
Value of machines ...	£15,048	£3,344	£3,622
Value of parts ...	11,360	2,253	2,709
	£26,406	£5,597	£6,331

Exports of machines remain fairly consistent with the comparatively low returns of this year, although last month a slight decline was registered compared with the September figures. The total number of machines exported was 447, compared with 2,333 in October, 1920.

	1920.	1921.	1922.
Valuo of machines	£191,857	£35,034	£26,089
Value of parts ...	67,953	26,620	18,751
	£259,810	£61,654	£44,840



DEMONSTRATION OF WEATHERPROOF SIDECARS. More than 70 motor cyclists took part in a rally last week-end organised by the makers of the T.O.M. wind shield. The party outside the White Lion, Cobham, where they were entertained to lunch by Sir Walter and Lady Susan Townley.

NEXT WEEK. Reproduction of the striking coloured cover of next week's (Show Forecast) issue of "The Motor Cycle."

Thrills in the Fog.

Somebody has been complaining that life nowadays lacks the excitement and thrills of long ago. We suggest that they try a thirty-mile night run on a motor cycle over strange roads in a thick fog.

Humbers Introduce a Lightweight.

Yet another firm to introduce a lightweight model for next year is the Humber Cycle Co., Ltd., which for the last year or two has specialised on a 600 c.c. flat twin, but made a very successful 350 c.c. V twin before the war.

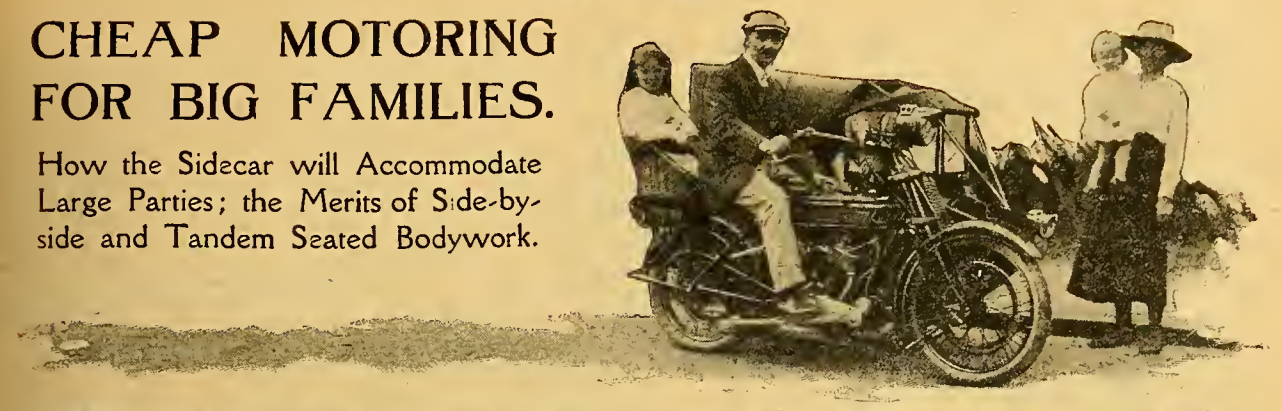
CHEAP MOTORING FOR BIG FAMILIES.

How the Sidecar will Accommodate Large Parties; the Merits of Side-by-side and Tandem Seated Bodywork.



An Enfield outfit, which usually carries a complement of six passengers.

THE first things to seek when purchasing an outfit to carry four, five, or six people are power and room in the sidecar body.

A 550-600 c.c. engine pulling a big load at good speeds will consume almost as much petrol as one of 900-1,000 c.c. under the same conditions. Nothing is more irritating than to feel under-powered against a strong headwind; others beside men with big family sidecars will agree with this.

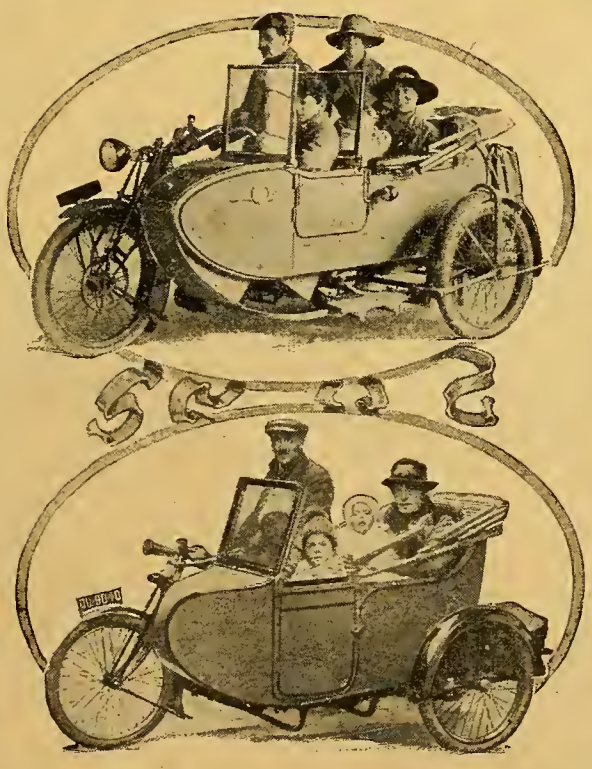
At Least 800 c.c. Required.

The first step, therefore, in the selection of a suitable outfit is to plump for a model embodying an engine of at least 800 c.c.

It can be safely said that all the big modern twin engines and three-speed gear boxes will stand up to any work to which they can be subjected in reason. The same can be said of the rest of the machine if common sense be used, always remembering that sidecar connections and the frame work will receive more strain with a heavily-loaded family sidecar than one of normal size. Alignment, too, should be watched closely, otherwise the tyres will receive abnormal wear, especially the front one.

Opinions differ on the type of body best suited to carry three or four persons. Some prefer the extra wide body, such as was shown by the Royal Ruby Co. at Olympia last year. The majority, however, appear to prefer a tandem seater.

One such outfit which we have seen is arranged with the driver's wife and youngest child occupying the back seat of the sidecar, two other children sitting side by side in the front seat, while the eldest is accommodated on the pillion. This is probably the best method of arranging such a party, and seems preferable to making use of a dickey seat or fixing a seat on the luggage grid in the manner adopted on the A.J.S. The latter method, however, seems to be preferred by the average small boy, who likes it better than sitting in the sidecar—a small boy would, of course, prefer such a place; it is unorthodox, and he can fidget to his heart's content, reach over to read the speedometer, and eat apples and sweets.



These two illustrations speak for themselves, and show graphically how easily big families are accommodated on a sidecar.

Making the Children Comfortable.

The above-mentioned children, incidentally, are rigged up with inexpensive leather helmets at 5s. 6d. each. They do not wake up in the night crying with earache in consequence of the side draughts, which sometimes whistle round sidecar screens. On this particular outfit, however, the owner has also fixed side-curtains on the off side, reaching from the front screen and extending to the rear of the sidecar.

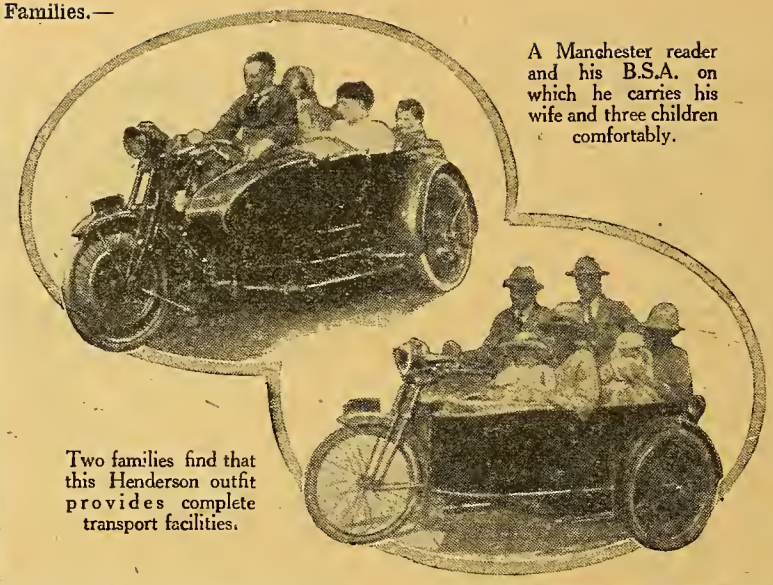
He was at great pains, too, fixing the pillion rider so that the child's legs were not frozen; this is a detail forgotten by hundreds of owners who seat youngsters on the carrier.

Another vastly important thing in connection with pillion riding is often ignored; that is the springing of the seat itself. For small children the springs of a standard pillion seat are usually much too strong, and many youngsters complain of internal pains after a long ride simply in consequence of this. Any pillion seat maker will fit springs to suit a particular weight if asked to do so.

In selecting a family out-

Cheap Motoring for Big Families.—fit the question arises of buying a machine separately and fitting a special sidecar, or of going to a firm which specialises in double seater outfits. One way is no better than the other.

Possibly the complete outfit would be a better selling proposition second-hand, the enamelling of the machine and sidecar is usually more uniform, and the attachments and lugs in most cases are built into the frame of the machine. But these things do not completely outweigh the pleasure of purchasing a separate sidecar possessing particular attractions or advantages which the specialists in sidecars know how to embody.



A Manchester reader and his B.S.A. on which he carries his wife and three children comfortably.

Two families find that this Henderson outfit provides complete transport facilities.

It can be taken for granted that one must motor cheaply if five or six be the usual complement. There is no cheaper motoring; in fact, there is no cheaper travel at all unless it be by excursion train, and sidecar costs may even beat excursion fares if a party of six has to be accommodated.

Although rather paradoxical, the more miles one accomplishes, the cheaper motoring becomes. If one can afford to buy the outfit in the first instance, pay taxation, insurance, and garaging, then it becomes parsimonious to begrudge the actual cost of running. Yet, strangely enough, this is often what happens.

It is ridiculous not to take the very fullest advantage of a vehicle that gives zest to life and enables one to appreciate to a fuller extent this country of ours.

The parsimonious motorist may in an average year cover 2,000 miles in this manner.

	Miles
Summer holidays	600
Say, 30 week-ends and odd days	1,400
	2,000

Rough cost of petrol oil, depreciation, garaging, etc., 5d. per mile.

This averages slightly under 1d. per mile per passenger.

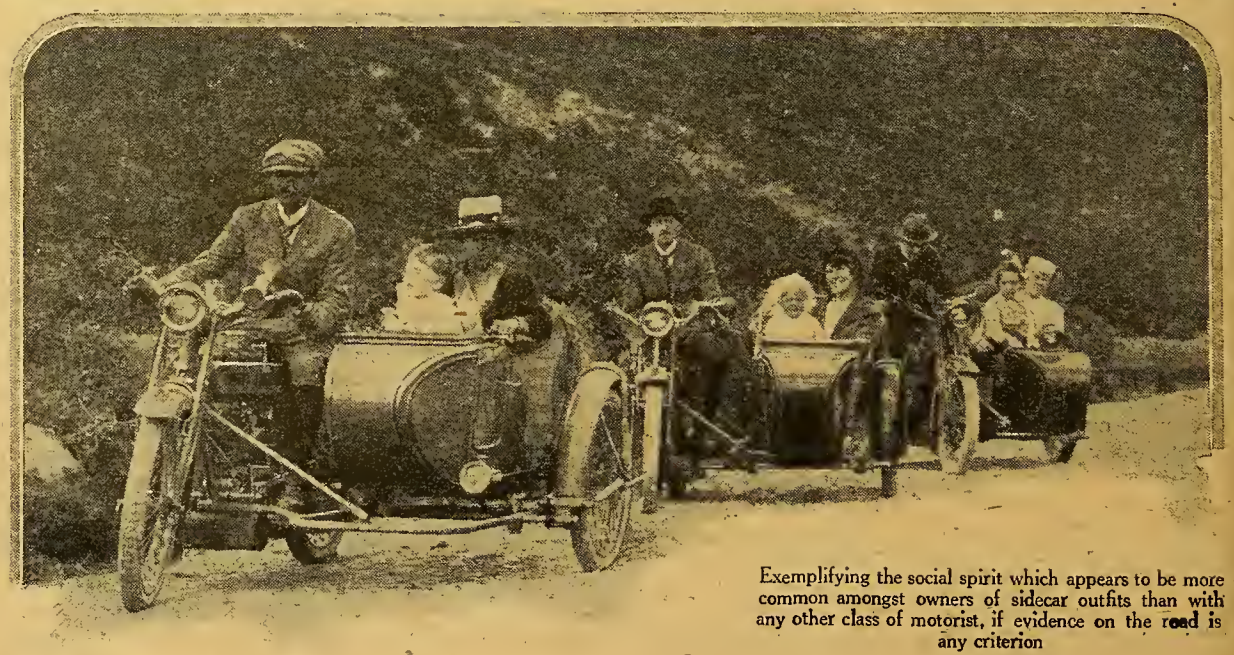
Now if 8,000 miles a year were covered, the cost would be well under ½d. per mile per passenger.

Instead, therefore, of making the sidecar run a special treat, set out on every possible occasion.

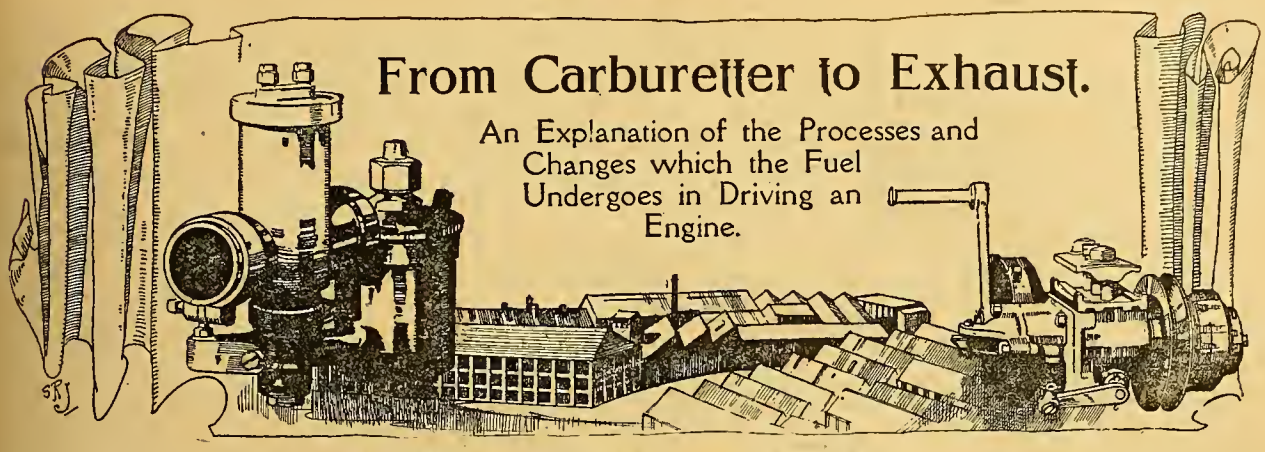
In order to cut expenses to the minimum, all meals should be of the *al fresco* variety; hotels can be ignored if one carries vacuum flasks and luncheon baskets.

Insurance against third party risks, fire, and theft alone need be effected if the owner is a careful driver (and all family men should be).

Naturally, a heavily-laden machine must be kept in good condition; covers, inner tubes, and chains must all be watched to guard against a sudden failure which, when away from headquarters, would incur an hotel bill for six people.



Exemplifying the social spirit which appears to be more common amongst owners of sidecar outfits than with any other class of motorist, if evidence on the road is any criterion



From Carburetter to Exhaust.

An Explanation of the Processes and Changes which the Fuel Undergoes in Driving an Engine.

By HAROLD J. POOLE, B.Sc. (London), A.I.C., F.C.S.

IT is very easy to some people to pour petrol into a tank and hear it end up at the exhaust and to leave the matter at that.

By most, however, a little knowledge is desired as to what happens in between and why, and it is for these that the following description has been written, to throw some light on the business with the aid of recent research on similar problems in other fields.

Carburation.

Since all motor cycle carburetters are now of the jet type, we will confine our attention to this kind only. The mechanical principles involved in this apparatus are so well known that elaboration is unnecessary, but a little illumination on the inner mysteries of vaporisation might not be unwelcome.

It must be borne in mind that no carburetter can supply an indefinite amount of vapour immediately at

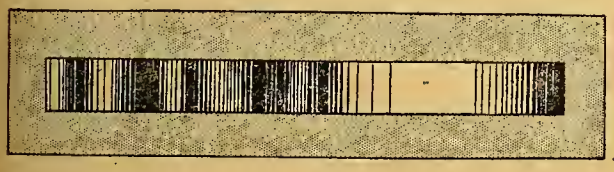


Fig. 1.

the jet; it simply produces a more or less fine spray which may or may not change into vapour subsequently, according to the conditions of temperature and velocity. Now, since it is the vapour that is needed for ignition, the efficiency of a carburetter will depend on the completeness with which the atomised charge is vaporised in a normal engine.

Vaporising the Fuel.

The main factors governing the evaporation of the fuel will be seen from the following conditions:—

(*a*) The fineness of the spray increases with the velocity of the gas past the jet.

(*b*) The rate of evaporation of the fuel is dependent on: the surface exposed by a given volume of the liquid in the spray state, the vapour pressure of the fuel, and the temperature of the air.

This last condition is even more complex still on inspection, because the temperature of the air varies from moment to moment; it is lowered proportionally to the amount of evaporation going on at any point; it is raised by the work done on it during compression and by the hot cylinder walls. The vapour pressure of the fuel depends also on the temperature of the drops and, to a smaller extent, on their size.

All these factors have to be brought into play in a very short space of time, viz., the time of one revolution of the engine, and it would seem that a speed limit would be imposed from the nature of things. We have seen, however, that the fineness of the spray increases with the air speed over the jet, so that the matter is to some extent automatically compensated, since a fine spray evaporates more quickly than a coarse one. But the two do not go in strict proportion, and it is conceivable that the flattening of the power curve of many engines at high speed is due as much to the slow inflammation of unevaporated spray as to air resistance. At any rate, it is, as will appear later, the only tenable explanation of "popping in the carburetter."

Effect of Humidity.

It is often stated that the presence of much water-vapour in the air induces better running, and it seems a fitting place here and now to discuss this effect and to clear up prevalent ideas concerning it.

In the first place, no more than a trace of moisture is necessary to catalyse the combination of petrol vapour and oxygen; secondly, an excessive amount is detrimental *as vapour*, because it is occupying space that might have been filled with air.

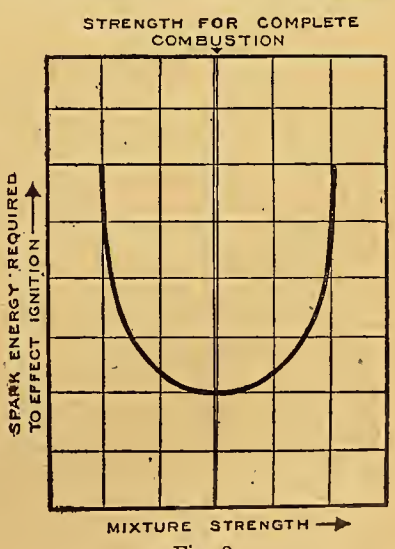

Fig. 2.

From Carburetter to Exhaust.—

Where it is undoubtedly beneficial is when it is present in a cold atmosphere, as mist, and lowers the explosion temperature by its latent heat of evaporation, and at the same time tends to straighten the expansion line of the indicator diagram. On theoretical grounds, at any rate, the use of "humidifiers" of the type where a coarse spray is sucked into the engine is strongly advised.

Igniting the Charge.

A very great deal of valuable work has been done in recent years on the ignition and explosion of inflammable gases, and while, in the main, this work has been devoted to problems connected with the safety of coal mines, yet there is much in it that is directly applicable to internal-combustion engines.

Since all motor cycle engines are electrically ignited, we will consider this in some detail. If the spark from an induction coil or a magneto be photographed on a rapidly revolving film, so that the picture is drawn out into a strip, we get in general an appearance such as is illustrated in fig. 1 on the previous page.

The explanation of this is that the first part of the discharge is rapidly vibratory, and resembles the discharge of a Leyden jar, while the last part is continuous, and resembles the "break-flash" or arc which occurs when a wire carrying a current is broken. The first part is known as the "capacity component," and the last as the "inductance component" of the spark. It has been very definitely shown that the portion of the spark responsible for igniting the mixture is the capacity component, and that the inductance component is largely inoperative. This is probably due to the much greater time-concentration of energy which occurs in this part of the discharge.

The Explosion.

It is in relation to the actual combustion that the most interesting research has been done. It has been shown, first of all, that the ignition of an inflammable gaseous mixture at atmospheric pressure is followed by three phases of transmission; first, a relatively slow uniform movement at about one foot per second, which gradually develops into a vibratory motion, which in turn develops into a detonation wave travelling at various speeds up to the velocity of sound. The work in question was carried out in connection with mining problems, and the question of compression naturally did not arise. It would seem safe to assume, however, that at the higher pressures utilised in internal combustion engines the same sequence of events would obtain, but that the speeds would probably follow a "square" law of pressure (except the detonation wave, of course).

The reasons for the existence of three phases are fairly simple. On ignition the gas round the plug points burns, and so raises the temperature of the surrounding layer of gas to its ignition temperature, and so on, so that there is a gradual inflammation spreading away from the igniting point at a speed

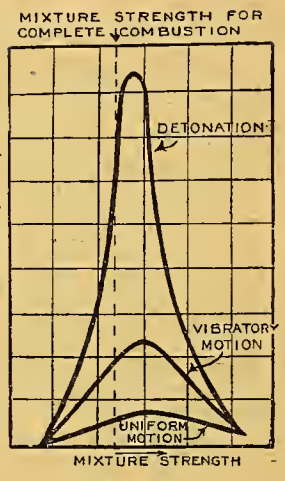

Fig. 3.

largely determined by the thermal conductivity of the gas. This cannot proceed very far before the cylinder walls are reached, and a certain amount of "bounce" is imparted to the gas, causing a vibratory motion. As this vibratory motion becomes stronger and stronger turbulence sets in, and the molecules of the gas are jumbled together with such force as to cause what I will loosely call "frictional ignition," which proceeds with velocities up to that of sound.

From this it will be seen that the real reason for advancing the spark considerably past top dead centre is to enable the slowest part of the ignition to be effected before the piston reaches the top of its stroke. It will be apparent also that, from the point of view of obtaining a fast-running engine, there should be a certain amount of turbulence in the cylinder, so that the "uniform movement" is reduced to a minimum.

Mixture Strength and Ignition.

All strengths of mixtures are not ignited with equal facility by an electric spark. The general rule so far observed is that the most easily ignited mixture is that in which the combustible gas is just completely burnt without any excess of air.

The manner in which the two vary together is shown in the curve, fig. 2, where the minimum strength of the capacity component of the spark is plotted against the mixture strength that it just ignites. The lowest point on the curve is near the theoretical mixture to obtain complete combustion. It will be seen that both very weak mixtures and very rich ones are equally difficult to ignite.

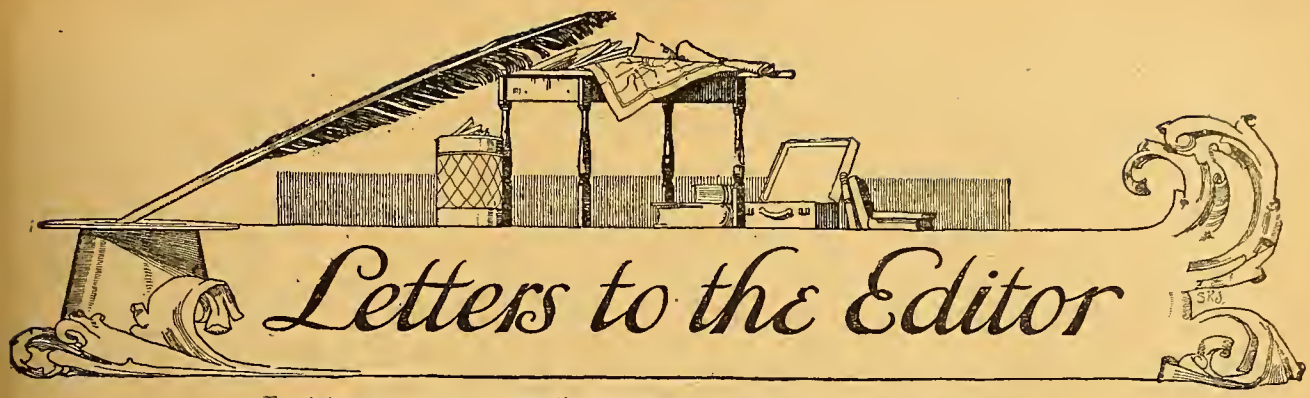
It has been shown how complex are the phenomena of ignition and inflammation, and it will be readily realised that the variations of the latter with changing mixture strengths are more complicated still. A typical case is illustrated in the curves in fig. 3, where the rates of the three phases are co-ordinated with the mixture strength.

The fastest rate, it will be seen, is obtained with a mixture somewhat richer than that which gives the greatest thermal efficiency. The reason for this is that the oxygen of the air is very much diluted with nitrogen. In an atmosphere of pure oxygen the highest rate would be obtained with the "correct" mixture. The inference to be drawn from this is, of course, that for very high engine speeds the carburetter should be set to give a richer mixture than for normal work.

THE MOTOR CYCLE

SPECIAL SHOW NUMBERS.

Next Thursday, Nov. 23rd. FORECAST AND GUIDE.
Nov. 30th. .. .. The Show Report.



The Editor does not hold himself responsible for the opinion of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address.

SCRAP THE LOT!

Sir,—I suggest that every motor cyclist visiting Olympia and seeing a motor cycle with a front rim horseshoe type brake, lay his hand on it and say to the salesman, "Scrap it!" C.T.P.

Birmingham.

ACCIDENTAL TUNING.

Sir,—It is a pity "Bemsist" keeps the secret of his magic touch; perhaps he had a hand in tuning "Zenooth's" 'bus?

I once added 15 m.p.h. to a 1911 Rover by a very simple alteration, but I give my secret to all and sundry for what it is worth.

Whilst decarbonising I accidentally knocked a piece off the skirt of the piston as large as a penny (with a King Dick!). As it was a sturdy piston, I assembled the engine with it in this condition and found it not worse, but many miles an hour better, and the old handle-bar vibration missing. I had accidentally perfectly balanced the old engine.

At some speed trials I astounded even myself by doing the flying ½ mile in 20⅘ secs. with a 5 to 1 gear. Somewhere about 58 m.p.h. and a good 3,000 r.p.m. I trust none of "Ixion's" pet novices will adopt this as a tuning hint, but will give then a good tip. Fit a 28in. wheel speedometer on a 26in. wheel machine and it sends the speed up nicely. That's how my Squirrel does 72 m.p.h.

Liss. "BEMOOTH."

MINIATURE SPARKING PLUGS.

Sir,—In your October 26th issue of *The Motor Cycle* I see a paragraph about miniature plugs. I may say I have had two Bosch plugs of this type since long before the war was over—and was offered, not once, but many a time, 10s. each for them. But I would not part.

T. WALKER.

BALLACHULISH FERRY.

Sir,—With reference to Mr. E. M. Wright's article in *The Motor Cycle* of the 2nd inst., I travelled on the roads he mentions several times during the early weeks of October. The distance from the north to the south side of the ferry is 25 miles, so that the detour is a considerable one, and is not worth while for cars, as the road on the north side is extremely narrow and steep.

I think the expense of making a feasible motor road from Fort William to Kinlochleven would be enormous.

On the whole, I fancy unless a bridge is constructed across the very narrow part of Loch Leven, the ferry will function for many a year to come. At the same time, chars-a-bancs did go round the existing road this summer.

DUNSTAN READ.

RACE TRACKS OF LIMITED USE.

Sir,—"Nortical" strikes a dismal note in his letter respecting the new race track at Derby. I believe the first consideration for building the track was the very commendable one of finding work for the unemployed. One of Nottingham's unemployment schemes is to make the river Trent navigable to the sea. Consideration for the ratepayer prevents the scheme being developed to allow for the passage of ocean liners. Most of the unemployment schemes fall short of the ideal for the same reason. If, as "Nortical" suggests, the only likely users of the track will be private owners, using sports models, surely this in itself should justify the building of it. I can assure "Nortical" that private owners are becoming "fed up" at padding competitions for the benefit of riders using freak machines, the makers of which immediately announce their success over so-and-so many starters. The use of freak machines is always denied, but we have it on the authority of the editor of a technical journal that the efficient life of a sprint engine on full throttle would probably be well under 100 miles. This fact cannot be too widely advertised.

I cannot agree with "Nortical" that the Derby track will provide only a third-rate show. In Clipstone Drive, Notts., we have one of the fastest straight stretches in the kingdom, and upon which on two occasions this year the flying half-mile has been covered under 18 secs. To the keen enthusiasts the performances were thrilling, but to the bulk of the 4,000 spectators, bored stiff by a repetition of single runs against the watch for hours on end, the brilliant performances were not appreciated. For this reason I consider that the Derby track, even allowing for slower times but enabling the spectators to "spot the winners," will prove a thorough success. J. SIMMONDS,

President, East Midland Centre A.C.U.

T.T. SPEEDS ON THE ROAD?

Sir,—I thank all my incredulous critics for their gentlemanly remarks. ZENOOTH.

Banstead.

Sir,—Being a rider of a 249 c.c. sports Velocette, it would be foolish of me to claim high maximum and average speeds; I have to be content with 45-50 m.p.h. and 27-32 m.p.h. respectively.

However, recently on a journey of 120 miles I passed fifteen machines up to 1,000 c.c. and was passed by only two myself, one being of 988 c.c. and the other 349 c.c.

My average was 29 m.p.h., and it is only natural that I should wonder where these speedmen, such as "Zenooth," take their daily jaunts; I have never met them.

A. H. HAWES.

Sir,—"Zenooth" seems to have roused a hornet's nest of doubters around his head regarding his average speeds. In consequence I feel obliged to champion the cause of the oppressed, and express the view that his speeds are quite within the grounds of possibility.

On several occasions I have covered the distance from Newcastle to Edinburgh (*via* Berwick, 120 miles) in three hours, *i.e.*, 40 m.p.h. on a 500 c.c. N.U.T. (touring) laden with various impedimenta in the form of Tan-Sad, suit case, and box, etc.

On one occasion I did 80 miles at an average speed of 46 m.p.h., allowing for a compulsory interview with the police, and ended up in the ditch with a large hole in the

back tyre, since when I have restricted myself to more careful driving.

Another "average" may interest your readers. I set out from the Lake district to Newcastle, accompanied by a friend mounted on a prehistoric two-stroke, which fell to pieces on the least provocation. Being one of the diehard brigade, he steadily refused to be towed, or adopt any other means of locomotion. The journey (90 miles) occupied 27 hours—average 3.3 m.p.h. Is this a record?

R. STANLEY ROBINSON.

Sir,—I think we must congratulate "Zenooth" on his marvellous imagination, if only because he draws forth such an excellent example of humour. I confess I looked forward to *The Motor Cycle* of November 2nd because I knew he would get it in the neck. I rather fancy he was pulling our legs. If not, then he deserved more than he got.

Preston. 20 MILE AVERAGER.

Sir,—I think that it is quite possible that "Zenooth" averaged nearly 50 m.p.h. from Barnet to Cambridge. In spite of its improbability, I make this statement for three reasons.

Firstly, I know "Zenooth" personally; secondly, I have ridden the Zenith in question myself; and thirdly, I have several times ridden pillion on it with "Zenooth" driving.

The Zenith was a standard twin sports model, but I can definitely say that I think it was considerably faster than most other machines of similar make and type. Anyway, in the days of its youth it did well over 70 m.p.h., reckoned both by Bonniksen and by timing by four people.

Epsom. H. 9941.

Sir,—If "Zenooth" happens to be the rider I saw pass the "Red Lion," Hatfield, at about 40 m.p.h. a few months ago, I quite believe his statements to be true, provided the machine is capable of over 65 m.p.h. on the level.

I cannot quite agree with "Bunseam," as I would rather meet a rider like "Zenooth" than some of the week-end, summer riders who potter about and need to think twice in an emergency. C. B. BICKELL.

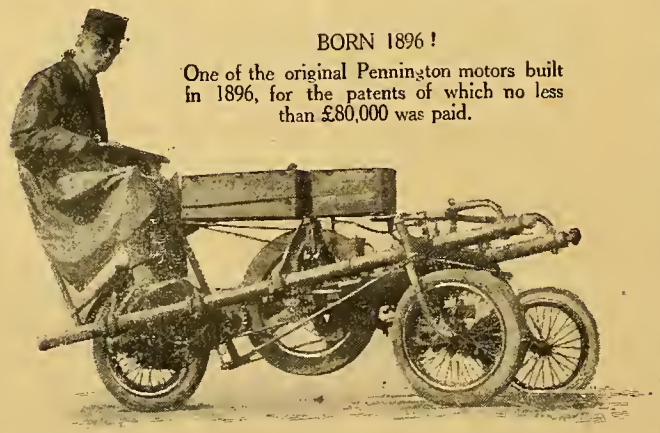
TOOL KITS ON SPORTING MACHINES.

Sir,—"Ixion," being privileged, airs a grievance *via* his "Occasional Comments" anent the paucity of tools in the one-tool-bag machine, and, lest such stinginess embitter *The Motor Cycle's* readers against all machines fitted with one tool bag only, I dash to protect the makers of the long-stroke Sunbeam from any such animadversion, and append a list of the tools contained in their solitary tool box:—

1 Lucas girder spanner.
3 ring spanners.
Set box spanners and tommy bar.
Pliers.
Screwdriver.
Chain adjusting spanner.
Valve cap and exhaust pipe spanner.
Magneto sprocket withdrawal tool.
Magneto spanner.
3 tyre levers.
Spare carburetter jets.
1 open-ended set spanner.
1 gudgeon removal tool.
A grease gun.

The spanners really *fit* all the nuts on the machine, and the only necessary additions are a thin set spanner for the tappets and a chain rivet extractor. Customary disclaimer.

A. G. WILLIAMS.



THE ETHICS OF HANGING-ON.

Sir,—Oh! Benedict, why damn a perfect case in ethics with scientific inexactitudes? Sure, tractive resistance is *expressed* as so many pounds per ton, but it is not overcome so easily. You take on one of the unemployed to "push up against the wall" of the garage for a day, and if he hasn't moved it—never mind his feelings—give him nothing at the end of it, because he won't have done any *work*. You'll win the resulting case at the local court. Work is quite another thing to force, and is only done when the point of application of the latter is moved; energy is the capacity for performing this feat, and power the rate at which you perform it. The rest follows as easy as you please.

The tractive force acting against your cyclist persecutor is a constant right enough, but double his speed—then the rate at which he overcomes this is doubled, his energy output is doubled, and so is the power he is called upon to expend, and "the guts" of a cyclist (or a motor or an earwig) is judged by the magnitude of this power and its stamina, by the length of time for which it can keep it up. SCHNAPS.

Schiedam.

CASTROL OIL FOR TOURING.

Sir,—What effect has Castrol oil on bearings, piston, cylinder, etc., when the machine is used for touring? I have recently started to use Castrol "R" in a 349 c.c. A.J.S. which is used for fast touring and the running results seem to be very good, but several people have warned me that I might expect trouble with the working parts of my engine by using this oil for fast touring. A. H.

We submitted this letter to the makers of the oil in question, Messrs. C. C. Wakefield and Co., Ltd., who have replied as follows:—

> "If fast touring consists of tearing along the road all-out, there is very little doubt that Castrol 'R' is the safest oil to use on this particular engine. In so doing, however, we express a pious hope that the oil will not be pumped into the engine at the same rate as the engine is travelling. One takes it that if a rider can blind along all-out without spoiling his engine he knows when it requires oil, and does not give it any until it requires it. With Castrol 'R,' 'limit the feed and eliminate the carbon.' With Castrol 'C' a bigger feed can be given, but with 'R' it is better to limit the feed because it will lubricate better with a little than with a lot.
>
> "C. C. WAKEFIELD & CO., LTD.,
> "E. A. EVANS, Chemist."

THREE-WHEELERS IN THE SIDECAR T.T.

Sir,—With a few exceptions, it was rather significant that the replies to the query with reference to the inclusion of the three-wheeler in the sidecar T.T. should have been abruptly in the negative, and as this was followed by no attempt to explain why, it seems to leave the impression that it is either too formidable an opponent, or that its roadworthiness in such an event would be a source of danger.

It cannot be said that this class of vehicle has ever shirked competing on equal terms with the sidecar, and the English Six Days Trials have proved conclusively that it can hold its own both for speed and reliability against all comers in such events, and as regards hauling and its attending dangers, I do not think the three-wheeler has been the chief offender in this respect.

Undoubtedly in such a race and such a course as the I.O.M. circuit, cornering would call for careful and skilful driving, but where the element of danger is concerned, I would much prefer being the passenger in a three-wheeler than in a sidecar.

This brings us down to the subject of the aims of such events. If purely to supply the public's lust for sensation, why not make it so by every means possible, but if the objective is to supply data "to improve the breed," then let it be the means of showing up the advantage and disadvantages of the types.

Although speed would be the deciding factor, it should be borne in mind that where this is obtained at the expense of the passenger and regardless of the exposure to which

he is subjected, some limitations in this respect would be necessary, otherwise sidecars similar to those we see at speed and hill-climbing events would be included.

As regards the limitations of capacity, the big twin will always hold its own in point of favour regardless of the question of economy where speed, comfort, and reliability are the aims, and I feel confident that much disappointment would be felt if this type of vehicle is left out of a class in which it has so ably maintained its reputation.

W. A. CARR.

Sir,—It is a well-known fact that on Brooklands Track three-wheeled cycle cars are unsafe owing to the way they swerve about, and as the track is 100 feet wide, I need hardly pass any comments on what is likely to happen if these cars are included in a race for sidecars on the narrow and winding roads of the Isle of Man.

D. R. O'DONOVAN.

Sir,—Thinking motor cyclists will do well to follow carefully and note the opinions of the more prominent personalities in the trade on the sidecar T.T.; the only to be expected divergence of expert opinion on the question of admitting the three-wheeled cycle cars could not be other than highly instructive. At the same time, the broader view taken by Mr. F. W. Giles (A.J.S.) and Mr. F. W. Barnes (Zenith) will go farther favourably to impress and give confidence to all of the unbiassed motor cycling public, and the great unplunged—a public more concerned with obtaining a high standard of comfort and service at a comparatively low cost than upholding a tribal fetish, whether it be sidecar or cycle car.

Such personalities as Mr. Giles, who does not fear, come what may, for the reputation of the progressive A.J.S., and highly successful inventive engineers like Mr. Barnes, whose eye is ever watchful for the slightest movement on the horizon of progress, mean much in the life of the everyday motor cyclist. For it is certain that if the race be not crabbed by the hidebound at the outset, and the A.C.U. attune its ear to the faint, though consistent, murmur of the multitude, there is much to be learned. And it is also most likely that whatever the motor cyclist of 1924 may have the good fortune to find himself on (or in), his thanks will be turned to one or other of those firms that had given the best hitherto.

EX. D.R.

Bournemouth.

AUTOMATIC SIGNALLING.

Sir,—As a motor cyclist, and also an engineer, who has made a study of automatic railway signalling for several years, I cannot see how you arrive at the conclusion that automatic signalling has only met with limited success on railways. There are several thousands of miles of railways in the U.S.A. and Canada equipped with automatic signals, also there is a law in several States in the U.S.A. compelling the railways to install these signals

I might also point out that it has been found to date that it is impossible to install automatic signals where two railways cross one another. Interlocking plants are used at these points, which are manually operated, but probably electrically locked.

C. D. BROADBENT.

STILL LESS EASY PAYMENTS.

Sir,—Referring to "Zenith's" letter on the subject of easy payments (for pedal cycles), I suggest that he check the figures of his example.

My rough figures are:—Cash price, £13 9s. 6d. Deposit, £1 7s. 5d.; 12 payments (monthly), £1 7s. 5d.; total payments £17 16s. 5d.

This means that £4 6s. 11d. interest is paid on a loan of £12 2s. 1d. If the principal were constant the interest would be about 36 per cent. as stated by "Zenith," but as the principal is diminished by £1 7s. 5d. per month the rate of interest is really about 86 per cent.

"PENMAN."

Dumfries.

ORGANISATION OF AN OPEN TRIAL.

Sir,—As a trade entrant in the Cheshire Centre A.C.U. Open Trial, I should like to endorse the remarks of your correspondent Mr. H. A. Leach about the organisation of this event.

JOHN W. MOXON.

Sir,—I feel I cannot help but endorse the remarks of your correspondent, Mr. H. A. Leach, about the organisation of the Cheshire Centre Open Trial.

The sooner the A.C.U. wakes up to some of these organisers of open trials the better. When one sees the Reliance Cup Trial, run by the Liverpool club, which has been an open event for years, run as a closed event, and then sees the Cheshire Centre Open Trial, one comes to the obvious conclusion that the governing body is neglecting its job.

ADSUM.

Birkenhead.

COMPOSITION OF CARBON DEPOSIT.

Sir,—The article by Mr. G. Middleton dealing with the composition of engine "coke" is interesting.

May not a fair proportion of the iron have come in through the carburetter also, since road dust would consist mainly of an iron-contaminated silica?

It would be interesting to perform a similar analysis of the carbon deposit from an aluminium alloy piston, etc. This might give an idea of the wear of some of the "hotstuff" engines.

INTERESTED.

Essex.

60 M.P.H. 350 c.c. MACHINES.

Sir,—I read with interest the letter from your correspondent, Mr. G. Rosekelly, on "The Charm of the 1,000 c.c. Solo Mount," but feel I must voice a protest against the belittling of the 350 c.c. bus.

I own a 1922 350 c.c. side valve single and feel quite sure that its standard of performance is not only "up to the performance of even an old 500 c.c.," but *superior* to many *modern* 500 c.c. mounts, and there are many "350's" that can equal it.

A "standard" machine in all respects, I find it comfortable, clean, neat, and as far as speed goes I think it does all an ordinary rider requires, *i.e.*, 60 m.p.h.

If "even an old 500 c.c. single" (standard) has a higher standard of performance than many "350's" I have in mind I shall feel inclined to eschew all matters motor cycling and subscribe to *Fur and Feather* or *Weldon's Home Journal* It's safer!

KURUMBA.

Northumberland.

EYE PROTECTION FOR THE SPECTACLED RIDER.

Sir,—It may interest some of your readers to know that, after having tried several makes and methods, we have quite satisfied a number of our customers by supplying them with the Willson goggles, style A1, fitted with their lenses.

The advantages are, that the correct centres can be got, a stock lens can be used (they will just take a 47 mm. lens, which is the largest stock lens made), the cost, in consequence, is not too great, and lastly, the metal case they fit is very compact. Usual disclaimer.

REVERSING BRAKING PRACTICE.

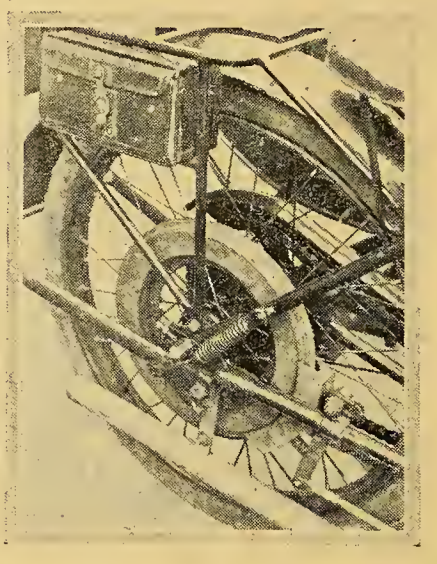
Fixed Metal Shoe and Revolving Friction Element for Brakes. Patent Granted to Motor Cycle Research Association.

A RADICAL alteration in motor cycle brake design has recently been patented which may have considerable bearing on future productions.

This new brake takes the form of a belt rim brake with the materials of its principal members reversed, that is to say, that in place of the dummy belt rim a Fibrax drum is employed and is clipped to the wheel spokes; this drum is V-shaped in section near its periphery, the V engaging in a correspondingly shaped metal brake-shoe.

To Decrease Wear.

Perhaps the chief advantage of this arrangement lies in the fact that the large surface of friction material exposed to the air prevents over-heating and consequent glazing, while the actual area available for braking purposes can, of course, be made the same as with the normal type of brake. In addition, the full diameter drum is naturally less subject to wear than a comparatively short shoe lining of the same fabric. The efficacy of this brake is beyond doubt, and we have had an opportunity of testing it in action on a 490 c.c. Norton sidecar and of making some comparatively severe tests.



An experimental brake with a metal block engaging a fibre drum.

Even when travelling at high speeds the machine can be pulled up quickly but smoothly without any symptoms of harshness or heating of the block. It is, however, on long hills that the new system shows to its greatest advantage, for it is claimed that there is no perceptible decrease in efficiency, however long the descent.

Our photograph shows the arrangement of the experimental brake, which can, of course, be applied to either front or rear wheels. Although neat in appearance even at this early stage, both drum and shoe will be improved in this respect without impairing the efficiency of the brake.

The brake is the patent of the Motor Cycle and Cycle Car Research Association, by which body it has been extensively tested.

This device is the first practical evidence of the activities of the Research Association, which promises to be of great assistance to its members, among whom are many of the best-known motor cycle manufacturers.

Presumably inventions patented by the Association will be available under licence to all its members.

SIMPLE FRAME SPRINGING.

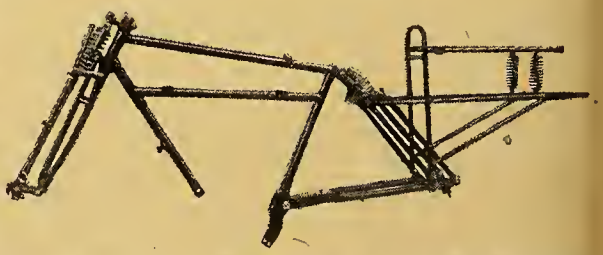
Re-designed Warner Device for Front or Rear Suspension.

OPERATING on the parallel ruler principle, a simple spring frame has been devised, and will be marketed in the near future, under the name Warner.

In essentials the frame is not new, since it has been produced previously in the form of an attachment for existing machines. Some difficulty was found in the early stages in making the attachment in any way universal, and, though quite a number of conversions have been in use with every satisfaction, it was decided to redesign the frame so that it might be fitted to almost any machine.

In its latest form both the complete frame and forks, working on a similar principle, are manufactured. The wheels are carried by separate girders linked to the main forks at top and bottom. A compression spring is employed to absorb the shocks, and the amount of compression is variable, to suit the weight of the rider, by means of a simple adjustment. In addition to this, the links are carefully designed in order to exclude dust, and lubricators are fitted wherever necessary.

The carrier also is hinged at the front end and sprung on coil springs at the rear, though the rear mudguard may be rigidly attached to the frame members at all necessary points of support. Both forks and rear frame may be obtained as separate units if desired, the address of the manufacturers being the Vowels Engineering Co., 237a, Corporation Buildings, Foleshill, Coventry.



Parallel link action for front and rear forks springing is employed in the Warner springing, which can be adapted to existing frames.

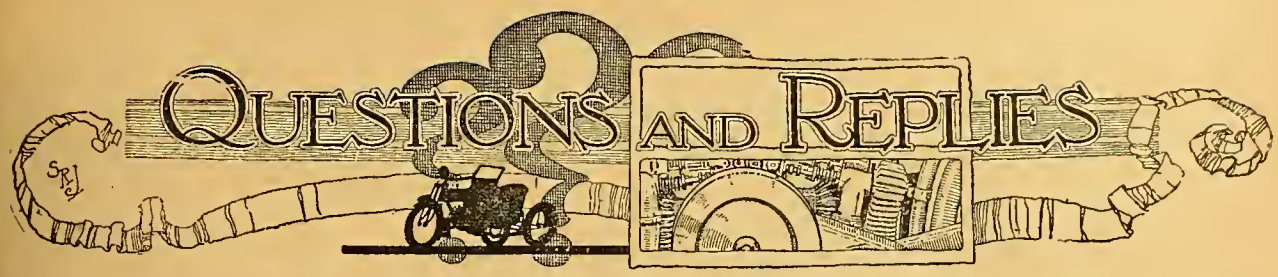
FOUR-STROKE VINDEC LIGHTWEIGHT.

CONSIDERING that the Vindec motor cycle is marketed by the well-known firm of Brown Bros., it is not so well known to the present-day motor cyclist as it deserves to be.

While not departing a great deal from conventional lines, the 1923 lightweight model has a very distinctive appearance, as visitors to the forthcoming Olympia Show will appreciate. Its engine is a J.A.P. of 292 c.c., the bore and stroke being 70 and 76 mm. respectively, and is accommodated in a neat frame having a sloping top tube. The equipment includes an Amac carburetter, M-L magneto, Druid forks, Sturmey two- or three-speed gear box, and 26×2¼in. Dunlop tyres.

Large aluminium footboards turned up at the front ends and exceptionally wide mudguards are fitted.

NEXT THURSDAY! "THE MOTOR CYCLE" FORECAST AND GUIDE TO THE OLYMPIA SHOW.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality

NEW VALVE SPRINGS.

? The mileage of my machine is about 4,600. Should you think new valve springs are necessary? The engine has done about 1,000 miles since last being decarbonised.—E.S.B.

Although the running would probably be improved by new valve springs, they should not be necessary unless those now in use show distinct signs of having been overheated.

USE OF PROFESSIONAL NAME.

? Am I in order in having my driving licence in my professional name, which I have now used for two years? It is not legally my real name, but I have a banking account in it.—N.B.

A driving licence should be in the applicant's correct name, and not in his professional or trade name. A driving licence is essentially a personal matter, and anyone who drives, for example, on behalf of a firm or company would have his own licence to drive, in his own name, although possibly the firm might pay for it. The form requires that the applicant's full name must be given, and this means his real name, and not an assumed or trade name.

NOTIFYING CHANGE OF OWNERSHIP.

? Ten days after purchasing a second-hand machine I was summoned for not having notified the registration authority of the change of ownership before using the machine; it was registered for the year, and everything else was in order, and the summons was issued after my own admission that I did not notify the registration authority till five days after purchase. Rule eight on the registration book does not state *when* the purchaser need notify the registration authority; moreover, there is no penalty mentioned for omitting to do so, though it specifically warns the seller of such penalty. Is there any ruling on this point? I should be extremely glad if you would give me your opinion, as I cannot see any justice in being fined for one's own honesty. Even now I have not had the registration card sent, and it is two weeks since the purchase.—H.R.L.

The regulation dealing with the registration of motor cycles states that on a change of ownership, either the old or new owner shall give particulars of such change to the authorities. If the old owner gave notice cancelling the registration and the new owner did not immediately apply to have it continued, the registration would be cancelled altogether. The regulation also states that notice of such change may be given before the change is actually completed, to take effect from that date. If these regulations are not complied with the registration is void. After you had purchased the machine you should have at once applied to have the existing registration continued. If you did not do so you are liable to be fined, unless the vendor did it. No time is mentioned, and it is a question for the justice whether five days delay is reasonable or unreasonable.

Important Dates.

Sat., Nov. 25th, to Sat., Dec. 2nd—Olympia Motor Cycle Show.

Tues., Dec. 26th, and Wed., Dec. 27th—M.C.C. London–Exeter Run.

Sat., Jan. 13th, to Wed., Jan. 24th (1923)—The Belgian Salon.

Fri., Jan. 26th, to Sat., Feb. 3rd (1923)—Scottish Motor Show.

"THE AUTOCAR" THE COMPLETE JOURNAL.

Every phase of automobilism is embraced by "The Autocar," the sister journal of "The Motor Cycle."

Light, medium and large cars are adequately covered in its pages. No artificial division of light cars from other types is attempted, or, indeed, is necessary, since the principles of design are identical and the interest of users, whether concerning questions of upkeep, taxation, roads, service or future development, are undivided and common to all.

Thus, "The Autocar"—the pioneer and the largest of all motor journals—forms the only complete record of the automobile movement, by embracing the interests of motorists in general.

EVERY FRIDAY . . . . . FOURPENCE.

SPEEDING UP A FLAT TWIN.

? Wishing to tune my 348 c.c. Douglas for speed, do you think that aluminium pistons and drilled connecting rods would effect an improvement? If so, would it be necessary to re-balance the engine? The carburetter is an Amac. Could I obtain special parts for it, and do you think that the machine would stand a higher gear than that at present fitted, *i.e.*, top 5½ to 1, low 8½ to 1?—J.R.

Tuning for speed is a matter for continual experiment and test, and although use of aluminium pistons and drilled connecting rods, special cams, etc., is generally made by speed men, it does not follow that you will get the results you desire without a vast number of experiments, some of which may be far from successful. With a flat twin it might not be necessary to re-balance after fitting lighter pistons and connecting rods, especially if the variation in weight from the standard fittings is not very great. You should fit the biggest jet possible in the carburetter, and obtain a speed model cam from the makers of the engine; also gear up as high as possible, experimenting with different ratios; time the spark, again by experiment, to the maximum advance possible.

STARVED ENGINE.

? My engine runs perfectly up to 26 m.p.h., but over that, or if I come to a small hill, it misfires and will not pull, but it goes better as soon as I close the throttle a shade. If I have anyone on the pillion seat it is much worse. The machine is a 1916 349 c.c. A.J.S., and everything seems to be in good condition; compression is good.—A.W.

Judging from the description you give, which is not very detailed, we should be inclined to recommend a thorough overhaul of the engine. The symptoms indicate also a restriction to the fuel supply, either at the jet (which may be too small) or in the delivery system. See that the petrol pipe, tap, and carburetter, and any gauzes or filters, are quite clear

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

"G.F.L." (Surbiton).—Paragon folding sidecar: safety and detachability.

"A.B." (King's Lynn).—Enfield twin, 1919 model: suitable lubricant.

"J.W.R." (Edinburgh).—998 c.c. Indian, 1914 single gear and clutch model: suitable economical carburetter, speed, tuning hints.

"A.B." (Shipley).—225 c.c. Royal Enfield: reliability as an all-weather mount, controllability.

"D.S." (Barton-on-Humber).—750 c.c. 1919 Rudge Multi: ease of cornering, tendency to knock, magneto adjustment.

"H.M. 2765" (Forest Gate).—292 c.c. Allon: speed, consumption, steering.

"L.W.B." (Croydon).—348 c.c. Douglas, 1921 three-speed: Amac carburetter, care of gears.

"P.A." (Brigg).—Carden, 1921 model: cleanliness, tyre wear.

"H.R." (Hulme).—348 c.c. Douglas, 1915 model: tuning hints and suitable carburetter (other than Amac) for speed.

"H.J.B." (Tottenham). — 596 c.c. Indian Scout and 500 c.c. N.U.T.: performance with sidecar.

"A.S.P." (Wilts.).—Binks three-jet carburetter on 976 c.c. Bat sidecar: slow running; acceleration; consumption.

"A.W." (Birmingham).—Extra air tap to prevent four-stroking on two-stroke machine.

"G.P." (Wimbledon Park).—998 c.c. Harley-Davidson, electric model: mechanical and driving hints.

"J.V.S." (Newcastle-on-Tyne). — 349 s.c. sports A.J.S.

"L.L." (Brondesbury).—Johnson's carbon remover.

"F.H." (York).—633 c.c. Norton sc., 698 c.c. Raleigh sc., 799 c.c. A.J.S. sc., 654 c.c. Quadrant sc., 598 c.c. Beardmore-Precision: performance in hilly district with "three up" (30 st.); suitable carburetter.

"S.S." (Cambridge).—486 c.c. Scott Squirrel: speed hints; most suitable plugs.

SPARKLETS

British Single's Success in Canada.

A well-known Canadian rider, Geo. Orange, captured the five miles open amateur championship recently at Ontario on a 499 c.c. Triumph.

Gear Box Efficiency.

On the occasion of his recent successful record-smashing attempts, H. Le Vack used a Sturmey-Archer gear box on his 998 c.c. Zenith-Jap.

Speed Trials Amendment.

We are asked to state that in speed trials held last month by the Stalybridge and District M.C., C. M. Needham was first and second respectively in the standing and flying start classes.

Plugs for Hot Engines.

Ninety-nine per cent. nickel electrodes, not 90 per cent., are used in the Hobson sparking plug, recently described "Among the Accessories." The price also has been reduced from 5s. to 4s.

Explaining the Magneto.

"How your Magneto Works" is the title of a well-written instructive folder published by the M-L Magneto Syndicate, Ltd., Coventry. The working of the new M-L magnetos is very lucidly explained therein.

A Chapter of Accidents.

In spite of the fact that he collided with straying cattle, and later broke a frame tube as a result of the collision, Christian Andersen, riding a three-speed Rudge machine, was the winner of a 613 km. road race held recently in Denmark.

In the Channel Islands.

New Imperial motor cycles have scored conspicuous successes in the island of Jersey. A 293 c.c. machine of this make gained second place in the Easter Reliability Trial, and in Le Pulec hill-climb similar machines took first and second places, while in the Autumn Trial they won the challenge cup. Many other successes stand to their credit.

Improving Appearance.

Used on a sidecar body a preparation recently submitted to us, and known as Accordian Auto-Shine, proved to be effective, not only reviving the varnish, but in bringing up the pegamoid upholstery in a remarkably efficient manner. It is sold by The Avondale Manufacturing Co., Avondale Works, Chippenham, Wilts, at 2s. a bottle.

Mechanical Lubrication.

Some amplification is required in the prices of Showell pumps, as described recently. 16s. 6d. is the price of the conversion set for machines with Best spring-loaded pump, and detachable sight; 25s. 6d. is for a similar conversion, but using the Showell sight valve; and 37s. 6d. is the cost of the complete lubricating set.

Non-Inflammable Celluloid.

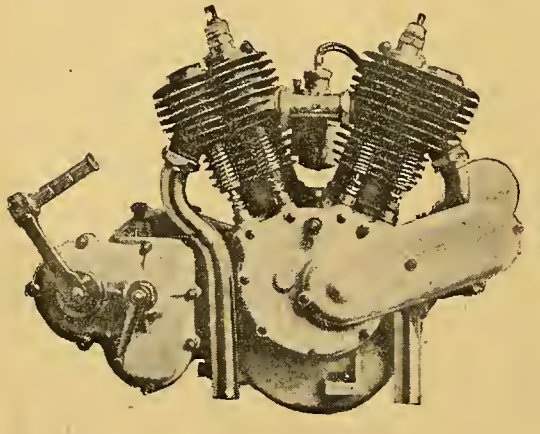
Known as Celastoid, a non-inflammable celluloid was amongst the exhibits at the Olympia Car Show. It should also be invaluable for motor cycle screens, and its makers, the British Cellulose & Chemical Manufacturing Co., Ltd., 8, Waterloo Place, London, S.W.1, possess testimony from the chief officer of the London Fire Brigade to the effect that it is practically flame-proof.

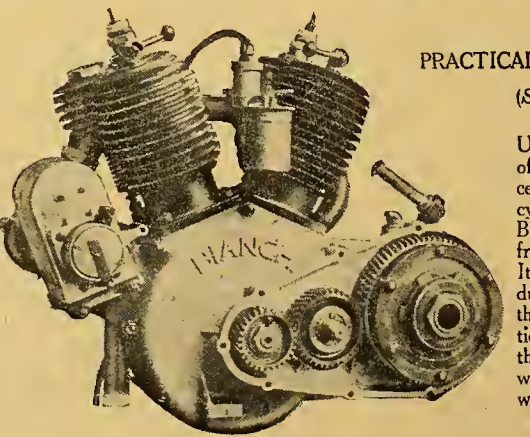
Coming of Age.

It is not only the M.C.C. which celebrates its twenty-first birthday this year. The Camping Club, which is as valuable to campers as the A.C.U. is to motor cyclists, will celebrate its coming of age at the Manchester Hotel, Aldersgate Street, London, E.C., on Saturday, November 25th. The club's president, Lt.-Gen. Sir Robert Baden Powell, Bart., will take the chair.

American Works Methods.

In *Engineering Production* of October 5th, 1922, a journal emanating from the same publishers as *The Motor Cycle*, there appears an interesting article entitled "An American Motor Cycle Factory: The Plant and Methods of The Hendee Manufacturing Co." Numerous riders of Indians may like to know how their favourite machines are made, and a reprint of the article can be obtained on application from The Hendee Manufacturing Co., Ltd., 366, Euston Road, London, N.W.1.

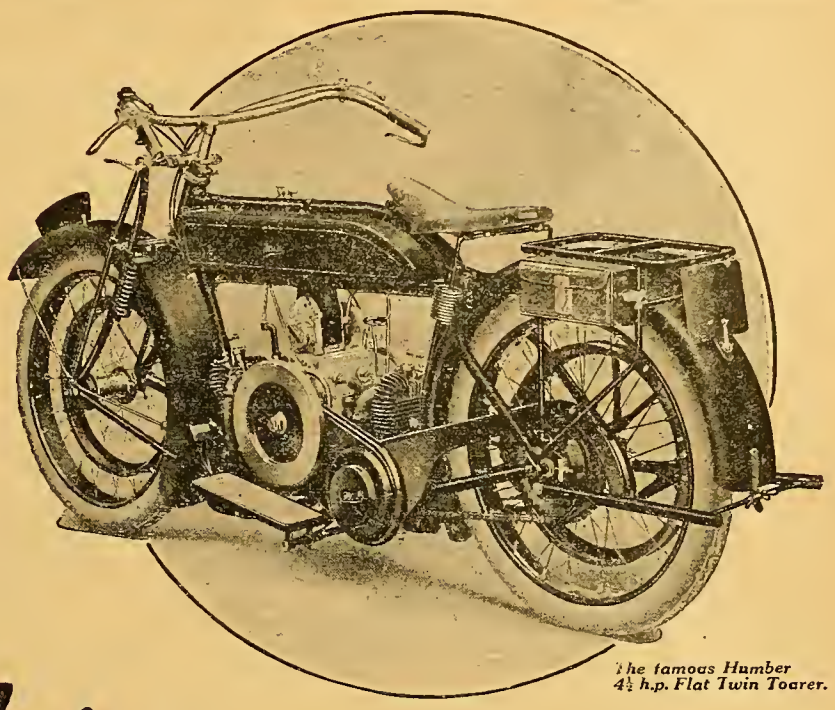




PRACTICAL ITALIAN DESIGN.

(*See page* 706.)

Unit construction is a feature of which the Italians are exceptionally fond in their motor cycle engine design. The Bianchi engine, which hails from Turin, the home of Italy's best automobile productions, is a fine example of this practice. Primary reduction to the countershaft is through enclosed spiral gear wheels. Excellent finish and workmanship has made Italian productions world famous.



The famous Humber 4½ h.p. Flat Twin Tourer.

Humber

A Reminder.

We cordially invite Motor Cyclists to make a note of the number of the Humber Stand at the Olympia Show—Nov. 25th to Dec. 2nd. On Stand 126 we shall be showing a full range of 1923 motor cycles, including Combination Outfits, Sports and Touring Models; also a sturdy Light Weight of 2¾ h.p. A concentrated study of each of these models, side by side with the prices, will convince you of the exceptional value offered.

Every attention will be given to visitors by our Representatives at the Stand.

Notice to the Trade & Public

Trewso Pat. No. 10,677. 1912.

One or two firms have put on the market imitations of the "Ritchie" Patent Motor Cycle Split Overall. Proceedings have been taken against these firms for infringement of the patent, and the trade are warned against purchasing these imitations. After this formal announcement the purchaser, as well as the seller, is liable in damages for the infringement.

These imitations are much inferior in make and finish to the genuine article. Every genuine "Ritchie" Patent Split Overall bears a label with the patent No. 10,677.

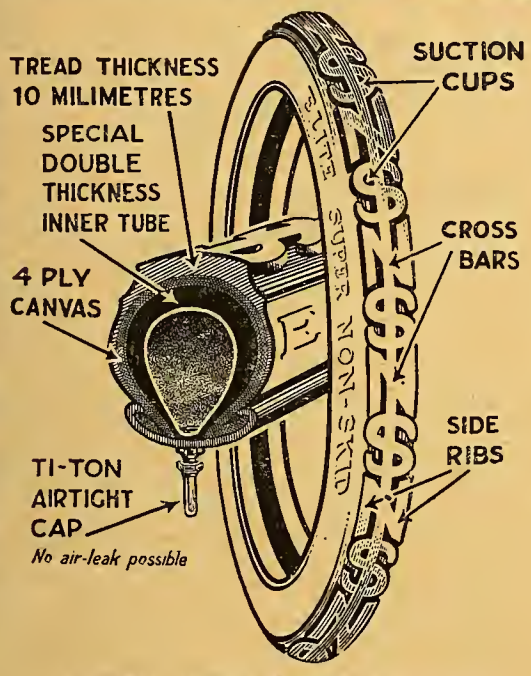
THE BEST TYRE *you can fit to Perfection*



This illustration represents a 28 × 3 Elite Super Non-Skid Cover showing section with special thickened inner tube.

ELITE SUPER NON-SKID

EXTRA HEAVY MOTOR CYCLE COVER

has been designed to withstand the kick of any motor cycle engine yet made, and to last out any other make. Guaranteed to give you at least 33⅓ per cent. more mileage, this cover embodies all the true principles that go to make a real rubber non-skid. The illustration shows this cover fitted with a special thickened inner tube which practically eliminates the risk of punctures and "nipping" when fitting.

The Elite Super Non-skid and special thickened inner tube are a combination of everything that is best in tyre manufacture.

In addition, we supply all our tubes with the wonderful Ti-Ton Dust Cap, which absolutely prevents any air leakage from the valve—a trouble so common to all other makes.

To introduce these special thickened tubes, to all purchasers of an Elite Super Non-skid with inner tube we are prepared to allow a special discount of 50 per cent. off the list price of the tubes at the following prices :—

Size.	Elite Cover. £ s. d.	Special Tube. s. d.

Specify Ferodo Brake Blocks on your new mount.

Prior to the introduction of Ferodo Brake Blocks for motor cycles, one set of blocks lasting throughout a long race was practically unknown.

Now it is the usual thing for riders in the big races to use only one set of Ferodo Brake Blocks for both practice runs and the actual race.

This is because Ferodo Blocks are made with the same care as Ferodo Friction Linings. They give the same efficient service—the same remarkable wear—and they never split in use.

Ferodo Brake Blocks can be fitted without any alteration to the shoes, and they are made for many standard models.

FERODO

Miracle Oil
For All Motors

Unequalled for upper lubrication.

THE FINEST INVESTMENT EVER OFFERED TO THE PUBLIC.

A Startling Fact!

After you have bought your first 32 ounce tin of Miracle Oil for 12/6, you may continue to buy and use Miracle Oil year by year and it will not cost you another shilling.

A bold statement, but a **fact.**
The Reason. By the time you have used your first tin you will have saved your original outlay of 12/6.
This 12/6 saved will buy you another tin and this will keep on repeating itself.
This saving is effected by **increased mileage.**
By decreased wear and tear in the great reduction of **friction** and heat in the most vital part of your engine.
By prolongation of the life of your engine.
By greatly reduced expense—your engine needing to be decarbonised less frequently.
By reduced loss of the use of your car when this is being done.
By largely reduced upkeep cost.
In addition to the above you have the **superlative pleasure** of a sweet-running engine.
All this is the result of the **Perfect Upper Lubrication** obtained by the use of **MIRACLE OIL.**

The reputation which Abingdon "King Dick" Motor Cycles hold the world over is due to the quality of the service they have always given. Three models: 3¼ h.p., 4¼ h.p., and 6/7 h.p. (twin).

ABINGDON "King Dick" MOTOR CYCLE ENGINE

A 6-7 h.p. twin cylinder engine for chain drive. "One of the Best"; "A standing testimonial to British Workmanship." Bore, 73 mm.; Stroke, 95 mm.; c.c. 795.

On Stand No. ***284*** *Gallery.*

"King Dick" SPANNERS

British made from solid steel drop forgings and capable of infinite adjustment. Always grip and never burr the nuts. Made in four sizes: 3 in., 4 in., 6 in., and 9 in.

Every genuine "King Dick" Spanner is guaranteed for ever.

Abingdon Works Ltd., Tyseley, Birmingham.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "The Motor Cycle," Dorset House Tudor Street, London, E.C.4. *Readers who reply to Box No advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6 and on all transactions over £100, 1%. All deposit matters are dealt with at Dorset House, Tudor Street London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one [illegible]

MOTOR CYCLES FOR SALE.

A.B.C.

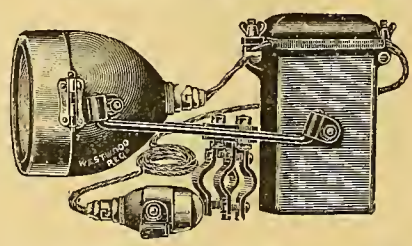
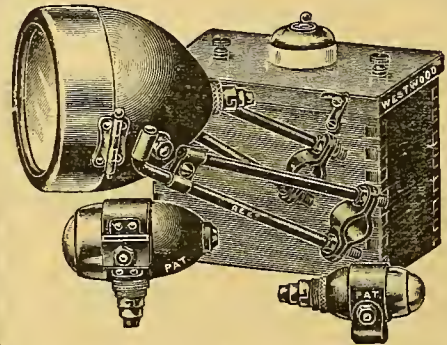
"DAYBEAM" Electric Solo Set



The Headlamp supplied with this set is our 5in Daybeam, a very powerful light-giver. The brackets are of exceptionally strong and handsome design They carry the headlamp and also the (die cast) aluminium case. The accumulator is specially made for motor cycle lighting, and will brilliantly illuminate the head and the rear lamp for 20 hours if used intermittently. The tail lamp (our torpedo S.B.C.) is exceptionally strong and well made, and has a very attractive appearance. Each lamp is fitted with a switch, and one lamp may be used independently of the other. The outfit is despatched completely assembled, and 4 volt bulbs are fitted. The finish is ebony black and nickel plate.

Complete Outfit, List No. 30/1, Price £5 5 0

"DAYBEAM" Combination Set



The set comprises Daybeam 7in. Headlamp, Idea Sidecar Lamp, and Torpedo S.B.C. Tail Lamp Each lamp is fitted with an independent switch, and is finished in ebony black with nickle-plated relief. The accumulator (capacity, 6 volt, 40 amp.) is specially made for motor cycle lighting, and will give very satisfactory service in use.

Complete Outfits, List No. 30/2, Price £7 7 0

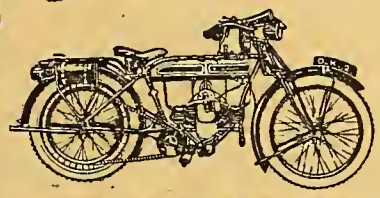
This 2¾ H.P. BURLINGTON DOUGLAS



FREE

Great New 'Burlington' Competition.

TO further popularise our well-known Sidecars, we are instituting the following interesting competition, in order to obtain a really good slogan for these Side-cars.

NOTE.—The type of slogan required is something similar to "Luxury Products at Economy Prices," or "Best on the Long Run."

All that is necessary is to send in your suggestion for a slogan, accompanied by an order for goods to the value of not less than 2/6. Every reader may send in as many suggestions as he wishes, providing each one is accompanied by an order to the value of not less than 2/6. Hence those sending an order for 5/- worth of goods are entitled to send two suggestions, and *pro rata*.

Messrs. The Commercial Publicity Company have kindly consented to act as Judges. Their selection will be considered final. An abbreviated List of spares and useful accessories will be found under our advertisement in the Miscellaneous columns.

SEND YOUR SUGGESTIONS EARLY.

MOTOR CYCLE SUIT

With Plaited Leather Belt.

GUARANTEED WATERPROOF

SPECIFICATION

MADE from hard-wearing double texture fawn material with an interlining of Rubber. Double Breasted Jacket, with all-round Belt and Leather Buckle, large Patch Pockets, and converted collar to button right up to neck, to fasten with Throat Tab. Wind Cuffs in sleeves. All seams of the Suit are rubber cemented and taped with extra material, making the garment absolutely waterproof.

Overall Trousers with spat-shaped leg; wind gussets to keep the wind from the leg and boots; fastened with patent clasp fasteners, enabling the trousers to be pulled off in a moment.

The suits are newly manufactured, and every care is taken with details so that the garment will meet the severest test.

We give full guarantee that this suit is thoroughly waterproof and impervious to the most drenching & continuous downpour.

THESE SUITS ARE NEWLY MADE FROM FRESHLY PROOFED MATERIAL BY EXPERIENCED WORKMEN, AND NOT HALF PERISHED CLEARANCE LINES OR W.D. SURPLUS.

MIDDLETON'S Spring Wheel Sidecar again wins Championship at Brooklands, making third successive year. Le Vack (Zenith-Jap) first, O. de Lissa (Motosacoche) second.

MIDDLETON'S Spring Wheel Sidecar again used for records. 50 miles, 100 miles, one hour, by Messrs. Temple and Allchin, on the famous Harley-Davidson.

MIDDLETON'S Spring Wheel Sidecar was used by the winners in the 200-mile race, Messrs. Davidson (Indiao) and Le Vack (Zcoith).

MIDDLETONS Supply on extended payments if so desired.

MIDDLETONS cater for New Poor and New Rich alike. Our sympathies are, however, with the former. We know how it feels, never having been anything else, for, as you are probably aware, we make nothing out of sidecars, just doing it, like the artists' model, for a bare living.

MIDDLETONS, London's Oldest-established Sidecar Makers. Business hours, 9 to 6; Saturdays, close 12. Sundays, like the Scotsmen, we stop in bed for economy. Saves wearing out boots, you don't need a fire, and it keeps the appetite down.—27, Stroud Green Rd., Finsbury Park. 'Phone: Hornsey 1584. [0522

DOORWAY Folding Sidecar saves garage. When folded (10 seconds) combination passes through ordinary doorway. Unnoticeable appearance when open, no freakishness; send for descriptions. Frank Whitworth, 139, New St., Birmingham. [5083

HOPLEY Folding Sidecar Saves Garage; attached to motor will go through passage 28in.; tandem bodies fitted; suits motors up to 10h.p.; changed from pleasure to commercial in few seconds; tested 8 years.—F. Hopley, Upper Highgate St., Birmingham. [0152

PARAGON (patent) Folding Sidecar saves storage, has 7 years to its credit, and has proved itself absolutely reliable. Fits any make of motor cycle, and, when folded, combination will pass through a 30in. doorway. Call and see it demonstrated.—Wincycle Co., Ltd., 236, High Holborn, W.C.1. [0388

ANY 1923 DOUGLAS MODELS NOW.

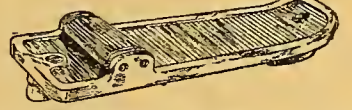
I am prepared to supply immediately and will return unconditionally any difference between the present price and the price ruling at the Show. Cash or Terms arranged to suit you. The 55 m.p.h. Coram-Douglas is the finest value in the world. The Douglas engine is further increased in efficiency by the fitting of Radiated Pistons with Patent Twin Rings, Air-cooled Patented Valve Caps, Racing Valve Springs and other improvements. Tony Combined Footboards and Footrests (polished aluminium), Zoom Zoom Exhaust System See me at the Show. Ask about Electric Lighting Equipment for the Douglas.

ADDITIONAL POWER may be obtained by fitting Special Lightweight Radiated Pistons, fitted with patented twin rings. They are simply wonderful, and every mail brings testimonials from all classes of satisfied riders. Price **29/-** per pair, complete with gudgeon, twin rings and copper caps.

PATENTED TWIN RINGS. The only really gas-tight and frictionless ring. Thousands have already been sold and not a single complaint. For 2¾ h.p. Douglas **1/6** each: 4 h.p. Douglas, Sunbeam, Humber, and Rover 77mm. bore, **1/8** each. B.S.A., Triumph (pre-1919), Rudge (pre-1921), Singer, New Hudson 3½ h.p., Precision 3½ h.p., L.M.C., 4 h.p., 85mm., **1/9** each. Other makes quoted for on application.

WHY SUFFER BROKEN VALVES? My valves are guaranteed 12 months not to break, scale, or burn, and never really need grinding in. They cost more, but the best is the cheapest in the long run. 4 h.p. Douglas **10/-**, 2¾ h.p. Douglas **9/-**, complete with special spring, collar and cotter. Other makes, Triumph, Rudge, A.B.C., etc., price on application.

THE TONY COMBINED ALUMINIUM FOOTBOARD AND FOOTRESTS. Beautifully finished — giving a natural riding position. A real solid cast job. Something that lasts for ever. Price **30/-** per pair complete.



AIR COOLED VALVE CAPS. My latest are covered by patents. They never blow out nor seize in the threads. Absolutely gas-tight. Prevent knocking and keep the engine cool. Try them on your 2¾ h.p. or 4 h.p. Douglas, and if you are not absolutely satisfied have your money back. Price **4/-** each.

ZOOM! ZOOM!! The popular Exhaust System. Beautifully made, finished in burnished nickel or copper. A pleasant Zooming note without back pressure. Adds pounds to the appearance of any Douglas. Price **30/-** in copper finish, **33/6** nickel.

BARREL VALVE SPRINGS. These springs prevent bouncing, and lighten the work on the cam. They are unbreakable and flexible. For 2¾ h.p. Douglas Racing, **2/-** per pair; touring, **1/6** per pair. Do not compare these with the cheap springs that are flooding the market.

ANY SPARE PART BY RETURN OF POST.

4 h.p. and 2¾ h.p. **INSTRUCTION BOOKS, 1/6** each.

IGNITION, LIGHTING, ETC.

RELIANCE Magneto Repairing Co.

RELIANCE for repairs, new magnetos and spare parts.

RELIANCE have the largest and most up-to-date repair factory in London.

RELIANCE carry out all repairs on the premises, including armature winding.

RELIANCE have one of the most modern winding plants and test rooms in the country, and can therefore offer you the following advantages.

TIME.—All work within 8 to 48 hours, and a solid 12 months' guarantee in writing to back it up.

CHARGES.—No flat rates. You are charged according to the work that is required, therefore you are not in some cases helping to pay for other people's repairs.

OUR Offer.—We shall be pleased to allow you to see your magneto on test after repair at our works. How many others can make the same offer?

RELIANCE have the following magnetos in stock, all fully guaranteed.

THOMSON-BENNETT.—Singles and twins, new, any degree, waterproof, variable, suit any engine; price 65/-.

C.A.V. singles and twins, new, ideal for any lightweight, 2¾h.p. and 4h.p. Douglas; 55/-.

BOSCH type Z.A.2, second-hand, enclosed, waterproof, variable, latest pattern, for Douglas 2¾h.p. and 4h.p.; £4/10.

ACCUMULATORS, best makes only, for all purposes, any voltage, charged and uncharged, always in stock; send for prices.

BOSCH enclosed, waterproof type D.A.L. magnetos, Government surplus, any degree, ready to fit on Indian, Harley, J.A.P., or any big single or twin. We guarantee these to give you slow running and easy starting, and they are in every way ideal for the big machine; price, carriage paid, £4/10.

GUARANTEE.—Every magneto, no matter what the price or make, is guaranteed by us. Not merely that same is in good order at time of sale, but a plainly written statement that we guarantee each machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors. List sent post free upon application.

RELIANCE were established in 1914, since when we have enjoyed a reputation which is second to none for straight and fair dealing.

Sheen Park Lawn Tennis Club,
May 22nd, 1922.

Dear Sir,

I am instructed by my Committee to say they are very pleased with the Pavilion you erected for them.

Yours faithfully, JOHN O. GRIFFITS.

122, Shortlands Road,
Sittingbourne, Kent.
August 17, 1922.

Mr. Brodrick,
The South-Western Appliance Co.

Dear Sir,

The St. Helier Building arrived on Saturday, two days before promise of delivery, and we are more than satisfied with it.

We erected it on Wednesday and it went together like clockwork. I am very pleased we left the order with you, as all who have seen it think the value is remarkable and admire the artistic appearance. Trusting and believing it will get you further orders from this district.

Yours faithfully,
THOS. E. KENNETT.

IGNITION, LIGHTING, ETC.

MAGDYNAMO Engineering Co., Ltd., for magnetos, spares, and repairs.

MOTOR Cyclists fit reliable high quality magnetos now and avoid certain failure of inferior magnetos.

BOSCH Enclosed Waterproof Type D.A.L. Magnetos, Government surplus, ready to fit on Indian, Harley, J.A.P., or any big single or twin, gives powerful spark at all engine speeds, makes your engine a real live engine, give you easy starting, smooth and rapid acceleration, high speed, and low fuel and oil consumption with increased power; price only £5 each, postage 1/6 extra; a 12 months' written guarantee sent out with each magneto. We give you satisfaction or refund cash.

PLEASE Note, the above type magnetos were originally manufactured for 200h.p. aircraft engines; therefore we have every confidence in claiming them to be the magneto you require for your big machine Fit one to-day, and see life with a live machine.

HARLEY-DAVIDSON Owner writes: "Magneto to hand; many thanks for prompt despatch, satisfactory in every way; will recommend to my friends."

ZENITH Owner writes: "Since fitting magneto have completed a run of 250 miles; highly satisfied; will certainly recommend these magnetos."

INDIAN Machine Owners.—Your high-class machine deserves a high-class magneto. We want 1,000 Dixie 420 magnetos; send your magneto and £4 now, and we will immediately despatch you a Bosch D.A.L.

READY to fit on your machine; there are no alterations to make.

WHY is it that the leading Motor Cyclists—the men who know—are almost all sending to us for their Magnetos?

THERE must be a reason; there is; it is because the Magnetos of quality and guaranteed service, supplied by Magdynamo, beat all other Magnetos.

MAGDYNAMO will take your old Magneto in part payment.

REMEMBER your magneto is sent on 14 days' approval against cash per return on receipt of your order; there is no obligation to keep it until you have used it for 14 days on your machine and are satisfied; let us send you one now.

ARE You a Discerning Douglas Owner? Do you want a reliable magneto with 12 months' guaranteed service that will give you starting without worry, a smoother running, and more powerful engine and better results from your Douglas? Then send for a latest enclosed waterproof type Bosch XA2 magneto now, price only £5, carriage 1/6.

C.A.V. Magnetos (not converted starters), ready to fit on Triumphs, B.S.A.'s, Nortons, and P. and M.'s, with 12 months' guaranteed service, price £3/10, carriage 1/6.

THOMSON-BENNETT Magnetos latest enclosed waterproof type (not converted starters), ready to fit on 55° Clynos and 180° Douglas machines, with 12 months' guaranteed service, price £3/10, carriage 1/6.

MOTOR Cycle and Car Owners, are you testing all your sparking plugs properly? Are you wasting pounds yearly by throwing away good plugs? Fit a Bosch aeroplane hand starter magneto on your garage bench to-day and always have your sparking plug tester at hand, price £2, carriage 1/6.

TRADE discounts and export quotations.—Write, call, or 'phone for terms.

A YEAR'S guarantee on repairs. Before you scrap that magneto, whatever its condition, let us see it: we will rebuild your magneto to look and work like new, no matter what make, within 3 days or 24 hours if urgent, and return it with a written 12 months' guarantee. While your magneto is being repaired we can lend you another free of charge. We could not make these offers if we were not certain of the quality of our work.

YOUR old magneto will be equivalent to new at a low cost. Send us your defective magneto now.

EXPRESS Dixie Repair Service. Your Dixie magneto, no matter what size, rebuilt equal to new and returned in 12 hours, at 30/-; a small extra charge for necessary replacements

C.A.V. Express Repair Department.—Your C.A.V. magneto, no matter what type, rebuilt equal to new and guaranteed for one year, returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

ARMATURE rewinding, no matter what make, type, or size, 11/6. Wound cores from stock.

The Forthcoming Show.

OF all the motor cycle exhibitions since the war the forthcoming Olympia Show gives promise of being the most interesting, both from the point of view of novelties and as regards possibilities of trade.

Many who wander round the Show in a casual manner will say that design has altered but little, yet this is not the case, for the past year has witnessed great strides in almost every branch of the industry.

The most outstanding feature of the 1922 exhibition is the introduction of a 350 c.c. solo machine by almost all the leading makers who have hitherto specialised on big machines of the double-purpose or passenger type. Next comes the evidence of a growing production of ultra lightweight models of approximately 150 c.c. capacity; this is highly important, and foreshadows the development of the light and moderately-priced two-wheeler which is to become the means of effortless and inexpensive transport for the multitude.

Welcome Price Reductions.

Prices in all classes of motor cycles have dropped until they are within measurable distance of pre-war figures; in fact, considering the improved specification of the modern machine they are in some cases actually lower. It is necessary to emphasise the matter of prices, for, combined with the recent drop in fuel, oil, tyre and accessory prices, it forms a great incentive to an increase in trade, while there are signs of a steady revival of industry throughout the country.

By these reductions in cost of the established types of machines, the lowering of maintenance charges, and the introduction of new models specially designed for small first cost and economical maintenance, the motor cycle is automatically brought within the reach of a spreading field of potential users.

There are more exhibitors at Olympia than ever, and consequently a wider choice is placed before the public, which has the opportunity of examining machines from 100 c.c. capacity to over 1,200 c.c.

In the accessory departments, the motor cycle industry has not rested on its laurels since the last Show. New ideas in equipment, lighting and ignition apparatus abound. Still greater efforts are being made to give improved protection from the elements.

Technical Progress.

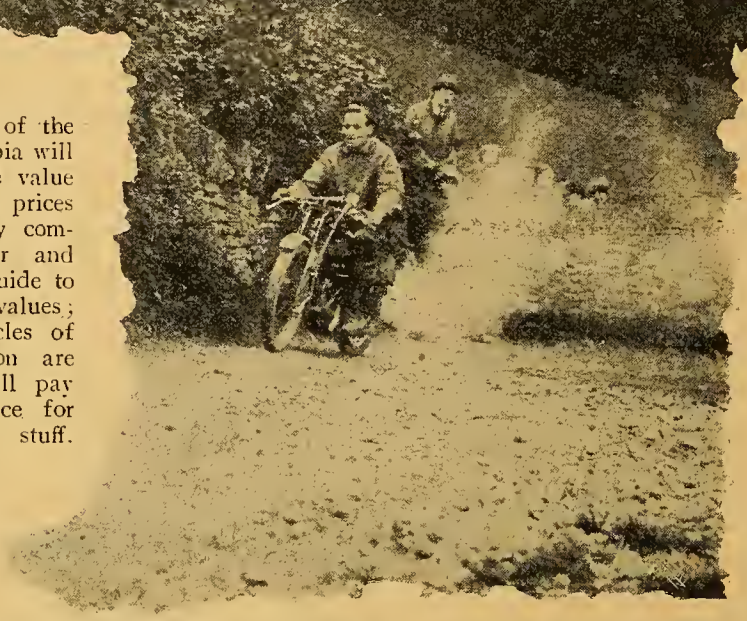
British big twins have once again sprung into the forefront, both as regards speed and general reliability. A wide choice of the popular 500 c.c. models is offered, and almost every firm of repute is producing a 350 c.c. model, while engines of even smaller capacity have been proved to be thoroughly reliable and even capable of sidecar work. Overhead valves have made some progress; unit, engine, and gear construction has gained a secure footing, backed by more than one leading firm. Four-speed gears are on the increase, and there is a steady tendency to design gears to suit the engine rather than to employ a standard box for all sizes. Chain drive is almost universal, except on low-priced models. The entirely enclosed engine and transmission has made its appearance, and mechanical lubrication has gained new adherents; but, if we are to register one small complaint, it lies in the fact that the present tendency to reduce prices to the uttermost has not encouraged the use of larger tyres on some of the cheaper lightweight models.

No motor cyclist who can possibly manage to reach Olympia should miss the opportunity of examining what will prove to be the finest display of motor cycles that has ever been staged.

An index to the advertisements in this issue will be found on page xlii of Supplement.

OCCASIONAL COMMENTS

BY "IXION."



Value.

THE keynote of the 1922 Olympia will certainly be value for money. The prices of such everyday commodities as beer and tobacco are no guide to motor cycle values; where most articles of daily consumption are concerned we still pay an increased price for the same old stuff. Motor cyclists still pay rather more than the 1914 figure for any type of machine or accessory. Value comes in because we don't pay these prices for the same old stuff. I often wonder whether other industries of which I possess no inside knowledge have made the same kind of miraculous advance which the motor industry has recorded.

During the war the industry was dead. Four years before the war I won a lot of the most coveted competition medals on a machine which was then regarded as extremely posh. I adjusted its tappets every morning. I inserted new con.-rod bushes after each big trial. I punctured every day in the trials, and often several times a day. I carried spare valves as a matter of course, and used them at short intervals. My bottom gear was ratioed at the sort of figure which occasionally wins an open hill-climb nowadays, so that hills were anxious work, and it took four variable gears to see me through a season. Four years have now elapsed since the war. If any of these mishaps had befallen me in 1922 my pen would have singed holes in the paper. We pursue our hobby in a fundamentally different atmosphere. No! It is certainly not the same old stuff.

Engines.

IT is naturally in the engine that progress is most apparent. We see veteran and impecunious brethren chug-chugging about on 1911 editions of our favourite 1922 make, and we fail to realise that our engine differs from theirs as the brain of a Marconi differs from the brain of a Kaffir. I once owned a four-cylinder F.N. It carried me well. Not being of recent date, it was not terrifically vivacious; and I had minor difficulties on occasion with its valves and ignition. Some weeks ago a colleague took me out for a lively day on a little modern car—the 8 h.p. Talbot. Though its power unit was only fractionally more capacious than that of my old motor cycle, the spirited little vehicle transported over half a ton load in two separate moods. In traffic it slid along like a flapper exhaling cigarette smoke. On the open road it attempted to outstrip the wireless waves with which the ether was doubtless sizzling. The same applies to motor cycle units. You can get more power out of a modern 500 c.c. than you dare use more than twice a year—my 1922 o.h.v. Triumph has never yet been all out on the road on top gear. I can get enough power out of 350 c.c. to propel me and ma' gal—except when ma' taste in gals temporarily resembles Lobengula's, and runs towards adipose tissue in lumps. I can get enough power out of 250 c.c. for all rational solo work. And the 1923 Olympia opens a new era in which 150 c.c. is going to satisfy quite a lot of people.

"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

And Gear Boxes.

THERE are not many items in which the motor cycle has the motor car down and taking a count, but the gear box is certainly one. Quite juvenile readers can recall the date when our gear boxes consisted of imitation alarm clocks, built into the rear wheel. You adjusted the control after breakfast. You injected a rather special oil at lunch. If you did not, towards 3 p.m. there would be a sickening scrunch, after which you might conceivably get home by roping the belt rim to the wheel spokes, and walking all hills. Alternatively, you possibly used a variable belt drive. If so, trying to catch a well-buttered eel swimming in Castrol would be child's play to the ascent of Amulree in a *pukka* Scots mist.

Occasional Comments.—

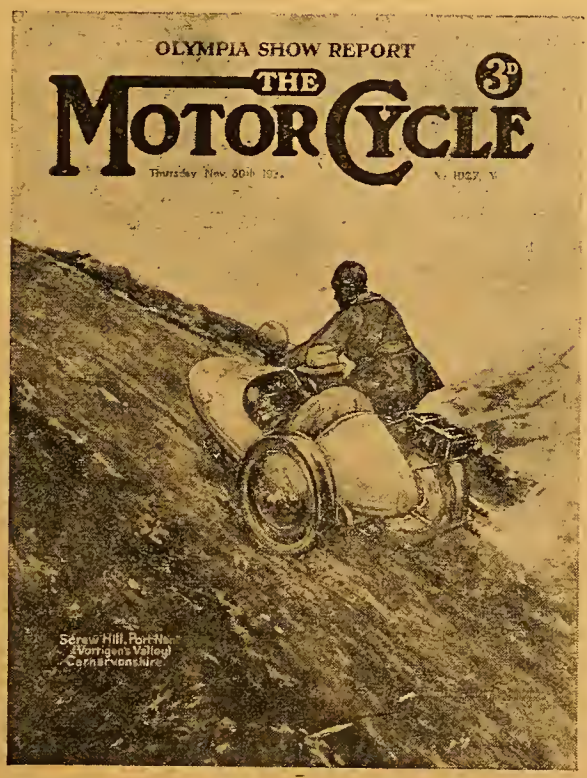
Even these gave trouble. I never climb Porlock without recalling a famous rider, who went west in the war, as he sat below the first bend, using language which made passing exhausts smell like may-blossom, and throwing out on to the road with both hands innumerable bits of a belt gear which had collapsed, and which he couldn't reassemble in the right order. One still has trouble with a car box on occasions. But not with motor cycle gears. Moreover, it is less bother to change from top to bottom at 40 m.p.h. on most cycle boxes than it is to effect a leisured silent change from third to second at 18 m.p.h. on many a car. On one of my 1922 mounts gear changing is as easy as taking out the clutch on a car. On the other, gear changing reminds me of Kipling:

> There are nine and ninety ways
> Of composing tribal lays,
> And every single one of them is right

For on this machine I can change gear by foot or hand, on the clutch, on the throttle, or on the valve-lifter, and each method ensures me a sure and silent change.

And Other Components.

THIS improvement of which I speak so feelingly applies to the whole machine. I have a pair of tyres which have done 7,000 miles this year without a puncture and with—I think—only one mild addition of pressure. I have valves which have not required re-grinding, and I have chains which are nearing the 10,000 mark and are still hearty and hale—indeed, one of them has only been adjusted twice. I have brakes which have run all year without being re-lined and only need adjustment when their wheels are re-set. I have one machine on which no part, however tiny, has ever worked loose or shaken off or needed tightening. I have a plug which was fitted last February to a hot-stuff engine, has run perennially in a blue fog (to judge from the slow running exhaust), and yet has neither overheated nor sooted nor burnt its gap too wide. I have a carburetter which has not been cleaned since it left the works last December; it has never choked a jet, never failed to start from cold within two digs, and has consumed petrol, benzole, fifty-fifty, and every sort of fuel without ever furnishing a bad mixture or delaying me for a single moment on the road.



THE SHOW REPORT. The coloured cover on next week's issue will depict a scene on the Screw Hill, North Wales.

Bring Weights Down.

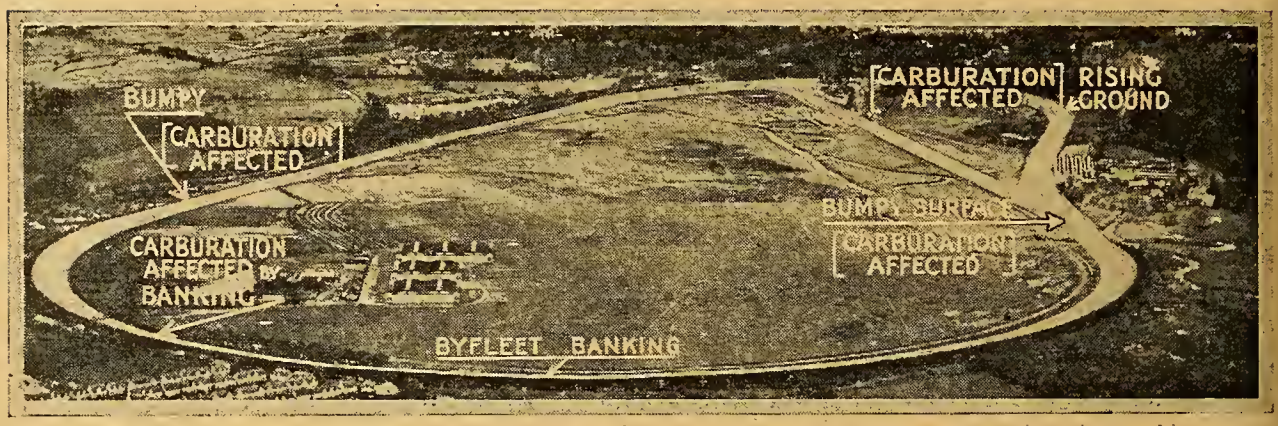
I DO not think or mean that weight reduction of existing models is being tackled as wholeheartedly as it might be. The tendency rather is to ginger up the power output of a given engine and add gadgets which increase the dead weight, leaving the performance the same or a little better. But by accepting an engine one size smaller, any rider who likes something which he can lead out of its stall with one hand may usually satisfy his whim. This summer, when I wished to conserve energy, I took out a machine scaling less than 198 lb.

Joyous Discomfort.

NOTHING amazed me more at the car Olympia than the conviction, embodied in so much coachwork, that the man (and especially the woman) of moderate means will tolerate acute discomfort. Some of the bodies variously known as "chummies," "occasional four-seaters," and—by the highbrows—as "single shells," were nominally designed to convey Papa, Mamma, little Bertie, and little Gussie. But we all know that they will very seldom be utilised for their designed load. You will see these "chummies" at the golf links with four slim lads in plus fours aboard. You will see them at the tennis courts with two men and two girls in white. You will see them on the Portsmouth Road with another square party—the two males in tan helmets and the two girls in—well, *I* don't know what they call them, but they're fetching. I am afraid that we motor cyclists are responsible for the genesis of these appallingly uncomfortable bodies. Do we not utilise sidecars designed to carry two folk in comfort for the conveyance of three or four adults in gross discomfort? Bill, on the saddle, is as much at the mercy of the elements as a weathercock. Lily, on the carrier, with her champagne silk ankles visibly shivering in a nor'-easter. Helen in the sidecar, nursing the luncheon or the tennis kit or the twins, as the gods decree. I really think designers would do better *to make it impossible for any vehicle to carry more than a rational load.* Spikes on the flat part of our carriers. Broken glass set in concrete on the tail of the small car. For the sad truth is that we don't like these surplus loads; but we haven't the pluck to be churlish when Helen says, "Oh, do let's take Lily along!" And Lily puts her head on one side and peeps at us through her eyelashes.

RECORDS AND THEIR MEANING.

The Freak Machine Bogey. Brooklands Difficulties. Records as Visible Signs of Progressive Engine Design.



Brooklands from the air showing where the natural and artificial conditions of the course affect the speed of a machine.

THE week or so prior to the Show is always a busy time at Brooklands track. In accordance with hallowed custom, manufacturers whose machines are in the van as regards speed capabilities strain every nerve to capture a few records, and one recalls how, in years before the war, the most coveted "selling point" at the Show was possession of the 500 c.c. hour record.

Many ordinary motor cyclists, it is to be feared, regard record-breaking as something which does not greatly concern them. They have an ineradicable impression that the machines upon which records are made are nothing more nor less than freaks—machines which could never be duplicated as a marketable proposition. Such an opinion, however commonly held, is not entirely correct.

Prepared Standard Models.

Although it cannot be gainsaid that occasionally a short-distance record has fallen to a machine which could not have lasted, in its "super-tuned" condition, for one complete lap of the track, such occurrences are less frequent than successes gained with engines which do not depart radically from standard design. Indeed, it is an undoubted fact that the majority of existing long-distance records have been accomplished with engines that, although they may have been most carefully prepared, are identical with the production models, even to the compression ratio and the valve timing.

It is not difficult to imagine the incredulity of the average rider who reads the foregoing passage. It is, moreover, a remarkable fact that if a rider strange to Brooklands were presented with a machine which had broken records and were timed round the track, his speed would be several m.p.h. below that which the engine had previously achieved. Many people are aware that riders who have carried all before them at speed events in different parts of the country have met with nothing but failure at Brooklands.

The fact is that Brooklands track is by no means the ideal speedway that it is popularly imagined to be. On the authority of D. R. O'Donovan—a rider who has probably spent more time on Brooklands than any motor cyclist living—the maximum speed that a machine will attain on the track may be as much as 4 m.p.h. less than that which it could record in identical time on a smooth, flat road. Proof of this was recently afforded by C. G. Pullin, who attained 94.79 m.p.h. in the Bois de Boulogne, Paris, on a 346 c.c. Douglas, when his previous maximum on the same machine at Brooklands had been less than 92 m.p.h.—and Pullin's knowledge of Brooklands is not slight.

The reason for this lies in the peculiar atmospheric conditions which prevail at different parts of the huge track and which have considerable effect upon carburation. Further, any wind, from whatever direction, enhances this effect, apart from its retarding influence upon the machine. The increasing number of inequalities in the surface of the track, too, add to the atmospheric disturbance upon carburation. According to the two riders named, some means of balancing pressure in the float chamber and the tank, as has been used by Pullin for a long time past, is of benefit in counteracting this effect.

Aids to Speed.

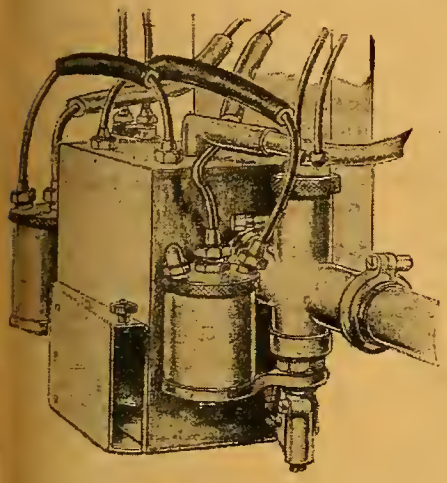
The foregoing passages serve to show that record-breaking calls for specialisation on the part of the rider, and should make it clear that some of the devices seen on successful racing machines at the track are not freakish aids to speed, but are attempts to normalise the Brooklands conditions. It also indicates why it occasionally happens that riders who are more or less invincible on the track are not necessarily successful away from Brooklands, just as a Harley Street specialist might not be the ideal general practitioner.

Records have—or should have—a real meaning for every motor cyclist. Perhaps it is a trifle unfortunate that the maximum speed records invariably receive more publicity than others which are of greater genuine value to the progress of design upon the sanest lines, but such a thing is inevitable. There is a human

Records and Their Meaning.—

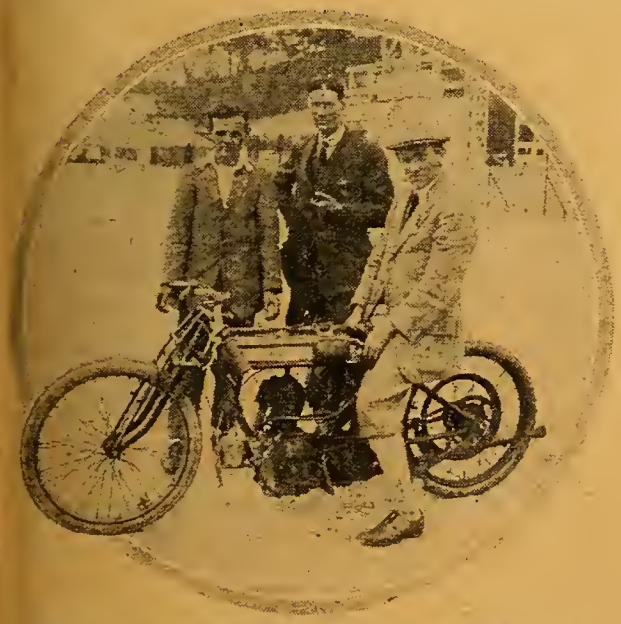
element in the attainment of a speed which has never before been reached, even though many riders of the same make of machine would be perfectly content if they could exceed half the record figure. Most people realise, however, that the machine which covers the flying kilometre at a hitherto "impossible" speed would be totally unsuitable for touring purposes, if only on account of its excessive compression ratio.

The introduction of the mean speed record was a move in the right direction. It eliminated the possibility of freak records put up by a machine specially



Twin carburetters with variable jets controlled from the handle-bar and a special air-intake are fitted to some of the Douglas racing machines. Caused by the speed of the machine a balanced air pressure is created on the petrol in the tank and in the float chambers.

tuned and geared to take advantage of some abnormal condition, such as a following gale. (A mean speed record consists of one run each way of the course, the second run to start within ten minutes of the commencement of the first run, and no alteration to the machine to be permitted between the two runs.) Mean speed figures, over the kilometre and mile distances, have, since the beginning of 1921, been the only ones recognised as world's records.



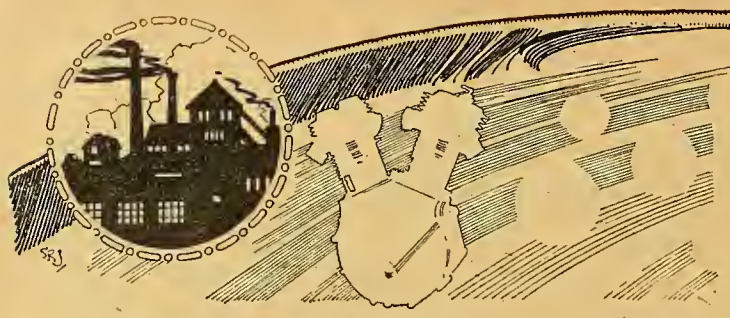
A trio of riders who have proved that standard engines, with super tuning, are well-nigh invincible. From left to right they are R. N. Judd, V. Horsman and D. R. O'Donovan—all Norton exponents. O'Donovan is one of the oldest and most experienced track men, with a helping hand for all whose Brooklands difficulties seem insurmountable.

When every second is valuable—filling up with petrol during an attempt at record breaking.

Records of upwards of 50 miles and one hour afford, perhaps, the best proof of a machine's capabilities. Over long distances at high speeds the engine parts cannot be lightened excessively, nor can the compression ratio be raised unduly. Such record attempts are real tests of the whole machine—engine, gear box, and frame—and when a sidecar combination is concerned the test is even more strenuous. In long-distance record attempts good design of certain components, such as cylinder, connecting rod, timing gear, and frame—which are almost invariably standard—counts for much, and it can be taken for granted that if imperfections are discovered in the progress of the attempt they will most probably be remedied on future standard models. No test can be so searching as, say, six hours at practically full speed.

Records and Progress.

Records, therefore, should be considered in the light of visible results of progress in research rather than as tuning achievements on freak machines. It is obvious that the efficiency of standard engines is increasing steadily, year by year, and that performances on Brooklands which to-day are considered phenomenal may in due time become quite within the scope of the ordinary production model. Three years ago 75 m.p.h. on a 500 c.c. machine had been attained by one or two "super men": to-day anyone can purchase a machine which, in reasonably expert hands, will do that speed, and more. But, better still, it will cover mile after mile at a reasonably high speed without the mechanical unreliability formerly associated with sustained pace. Records, therefore, should be valued at their true worth.



AN OPEN LETTER TO THE TRADE.

Importance of Export Trade. Increased Durability. Simplified Dynamo Lighting an Urgent Want. Sidecars or Cycle Cars? Service Depots.

GENTLEMEN,—It is my annual privilege, by the courtesy of the Editor, to write you, on the eve of the Show, a letter as a self-elected but typical representative of your great and grateful army of customers.

It is very pleasant for us all to recognise a change in the trade atmosphere. Trying to sell motor cycles during the last year or so has felt rather like trying to grow orchids at the North Pole. Now we are all beginning to feel like dormice in spring; the air is growing more genial, we are uncurling ourselves and stretching our legs and wagging our tails; and before long we trust things will begin to move. Prices have come down, money is growing more fluid. Given sensible government and peaceful neighbours abroad, commerce bids fair to re-establish itself; and then the queen of hobbies will enjoy full scope.
